

keV Sterile Neutrino Dark Matter Terrestrial Searches: Alive and Well

Wednesday 19 May 2021 14:00 (15 minutes)

What if the dark matter content of the universe was made up of sterile neutrinos with a mass of the order of keV?

Currently, constraints from the measured relic abundance of dark matter and from observations in the X-ray band threaten the possibility of finding in terrestrial experiments a signal of such sterile neutrinos produced through oscillation and collisions in the early universe.

We look at two scenarios in which the simple hypothesis of

- a low reheating temperature
- a new contribution to the sterile neutrino decay process

naturally relax these constraints and give new vigor to the hope of getting in the near future a proof of the existence of these elusive Dark Matter candidates in experiments such as KATRIN and ECHo.

Authors: Ms BENSO, Cristina (Max Planck Institute for Nuclear Physics in Heidelberg); Prof. LINDNER, Manfred (Max-Planck-Institut fuer Kernphysik, Heidelberg, Germany); Dr RODEJOHANN, Werner (MPIK, Heidelberg); Dr BRDAR, Vedran (Fermilab & Northwestern U.)

Presenter: Ms BENSO, Cristina (Max Planck Institute for Nuclear Physics in Heidelberg)

Session Classification: Neutrinos 1
