June 28, 2019

- After Chris Hunt's departure to CERN, started testing the beam selection routines he implemented
- Attempted to select samples that have matched optics in the upstream tracker
- Used NO ABSORBER 3, 4, 6, 10 mm, 140 MeV/c, flip mode data

Beam Selection (slide adapted from Chris Hunt)

- The magnet issue led to an improperly matched beam into the downstream of the cooling channel, limiting the transmission
- Initial matching into the upstream tracker was determined by beamline design
- Selecting the correct initial beam parameters should allow us recover the cooling performance
- Procedure:
 - ① Generate some data
 - ② Find a function that describes the data (the parent)
 - ③ Find a function that describes the required distribution (the daughter)
 - ④ Randomly select events based on the ratio of probabilities between the parent and the daughter

For a given event x ,

$$\text{Prob. of Selection} = \frac{\text{Daughter}(x)}{\text{Parent}(x)} \times \text{Some Normalisation}$$

- 1 SP in both TOF0 and TOF1
- TOF01 consistent with muon peak
- TKU: $135 \text{ MeV}/c < \text{total momentum} < 145 \text{ MeV}/c$
- $\chi^2/\text{ndf} < 8$ TKU
- Diffuser radius cut: $r < 90 \text{ mm}$

3 mm: β_{4D}

- Selection parameters: $\alpha = 0.0$, $\beta = 310.0\text{mm}$, $\epsilon = 3.0\text{mm}$, $L = 1.1$
- Black - initial sample, $T = 98.4\%$
- Red - selected subsample from the 3 mm data, $T = 98.8\%$
- Blue - selected subsample from the 3 mm and 4 mm data, $T = 98.9\%$

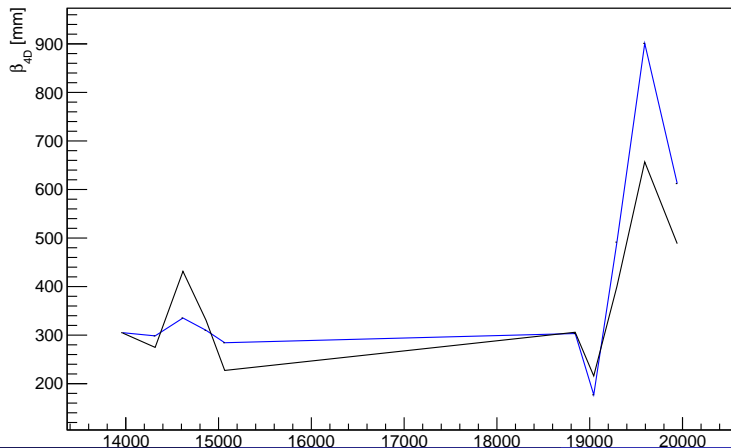

3 mm: α_{4D}

4 mm: β_{4D}

- Selection parameters: $\alpha = 0.0$, $\beta = 310.0\text{mm}$, $\epsilon = 4.0\text{mm}$, $L = 1.1$
- Black - initial sample, $T = 97.4\%$
- Blue - selected subsample, $T = 98.9\%$

4 mm: α_{4D}

6 mm: β_{4D}

- Selection parameters: $\alpha = 0.0$, $\beta = 310.0\text{mm}$, $\epsilon = 6.0\text{mm}$, $L = 1.1$
- Black - initial sample, $T = 94.3\%$
- Blue - selected subsample, $T = 96.5\%$

10 mm: β_{4D}

- Selection parameters: $\alpha = 0.0$, $\beta = 310.0\text{mm}$, $\epsilon = 9.0\text{mm}$, $L = 1.1$
- Black - initial sample, $T = 75.8\%$
- Blue - selected subsample, $T = 87.2\%$

- Beam selection routine improves the beam matching into the cooling channel
- Next steps:
 - Need to apply more cuts: 'banana' plot cut, TKD χ^2/ndf , TKD momentum cut, fiducial cuts
 - Apply selection routine to absorber data
