

Scintillation yield from electronic and nuclear recoils in superfluid helium-4

Friday 27 March 2020 14:00 (15 minutes)

Superfluid He-4 is a promising target material for direct detection of light (< 1 GeV) dark matter. Signal channels for dark matter - nucleus interactions in superfluid helium include prompt photons, triplet excimers, rotons and phonons, but measurement of these signal strengths have yet to be performed for low energy nuclear recoils. A measurement of the prompt scintillation yield from electronic and nuclear recoils was carried out in superfluid He-4 at ~ 1.75 Kelvin, with deposited energy in the range of 10-1000 keV. The scintillation from a 16 cubic cm volume of superfluid He-4, with tetraphenyl butadiene as wavelength shifter deposited on 1-mm thick quartz panels, was read out by six R8520-06 MOD PMTs immersed in the superfluid, each individually biased by a Cockcroft-Walton generator. Elastic scattering of 2.8 MeV neutrons (generated by a deuterium-deuterium neutron generator) from superfluid He-4, with a liquid organic scintillator module used as far-side detector, was used to determine the scintillation signal yield for a variety of nuclear recoil energies. For comparison, Compton scattering of Cs-137 gamma-rays with the superfluid He-4, with NaI scintillators used as far-side detectors, was used to determine the scintillation signal yield of electronic recoils.

Primary authors: LIN, Junsong (University of California Berkeley); BERNARD, Ethan (University of California, Berkeley); Ms BERNSTEIN, Madeline (University of California, Berkeley); BIEKERT, Andreas (University of California, Berkeley); HERTEL, Scott; KRAVITZ, Scott (Lawrence Berkeley National Laboratory); MCKINSEY, Daniel; Mr PATEL, Pratyush (University of Massachusetts Amherst); PINCKNEY, Harold (University of Massachusetts at Amherst); Mr ROMANI, Roger (University of California, Berkeley); SERAFIN, Alessandro (University of Massachusetts); Mr SMITH, Ryan (University of California, Berkeley); Dr SUERFU, Burkhan (University of California, Berkeley); VELAN, Vetri (University of California, Berkeley); Mr YUAN, Lanqing (University of California, Berkeley)

Presenter: LIN, Junsong (University of California Berkeley)

Session Classification: Session 13

Track Classification: Non-directional direct dark matter detection
