2019.9.25 (Wed.)
24th Geant4 Collaboration Meeting @ Jefferson Lab.

Background

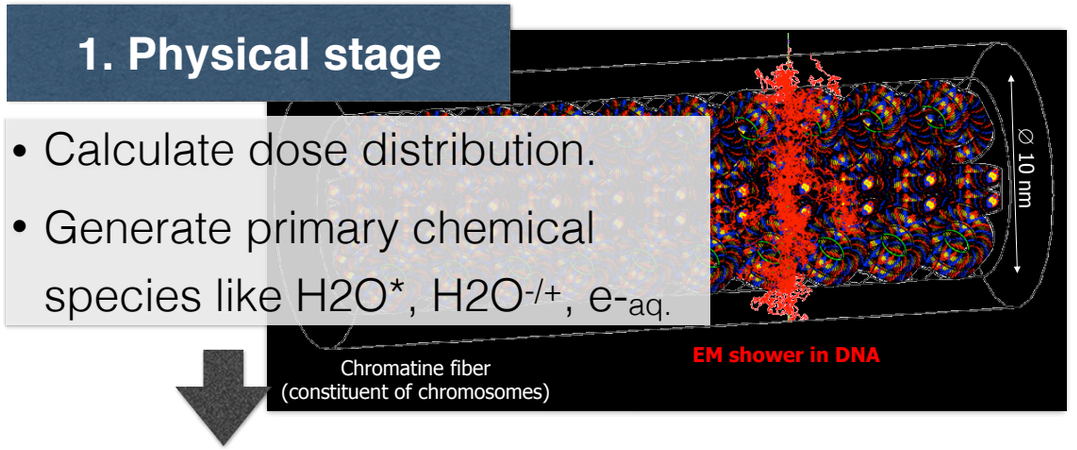
- Geant4-DNA simulation needs a long computation time
  - Tracks a large number of particles and molecular species with the Monte Carlo method

- MPEXS-DNA: A nanodosimetry simulator running on GPU
  - Succeeded to boost up computing performance for physics and chemistry simulation drastically
  - Can accelerate simulation studies on nanodosimetry

- Next step:
  - Implementing an alternative model for chemistry simulation
  - Quantitative DNA damage estimation

MPEXS-DNA: A Nanodosimetry simulation on GPU

- Rewrite Geant4-DNA (10.2.p3) in CUDA
  - EM Physics with lower energy range (down to meV)
    - Calculate local energy loss and generate primary molecules like H_2O^* and $H_2O^{+/-}$
  - Radiolysis of water
    - Diffusion and reactions for molecular species
    - Adopting the *step-by-step* method
  - The biological stage not yet implemented
- Collaboration between  and 
- Published a paper on MPEXS-DNA from Medical Physics



Estimate SSBs and DSBs using distributions of energy loss and molecular species inside the cell nucleus.

MEDICAL PHYSICS
The International Journal of Medical Physics Research and Practice

doi:10.1002/mp.13370

Research Article

MPEXS-DNA, a new GPU-based Monte Carlo simulator for track structures and radiation chemistry at subcellular scale

Shogo Okada, Koichi Murakami, Sebastien Incerti, Katsuya Amako, Takashi Sasaki

First published: 28 December 2018 | https://doi.org/10.1002/mp.13370

Physical Stage

- Most of the physics lists for Geant4-DNA are covered
- Some physics models released after 10.2.3 are not implemented
  - The CPA100 model (elastic scattering/ionization/excitation)
  - Physics interactions for DNA components
  - …

→ will be implemented soon

✔: Available, ✘: Later

Physics lists for G4DNA (10.5.1)	MPEXS-DNA
G4EmDNAPhysics	✔
G4EmDNAPhysics_option1	✔
G4EmDNAPhysics_option2	✔
G4EmDNAPhysics_option3	✔

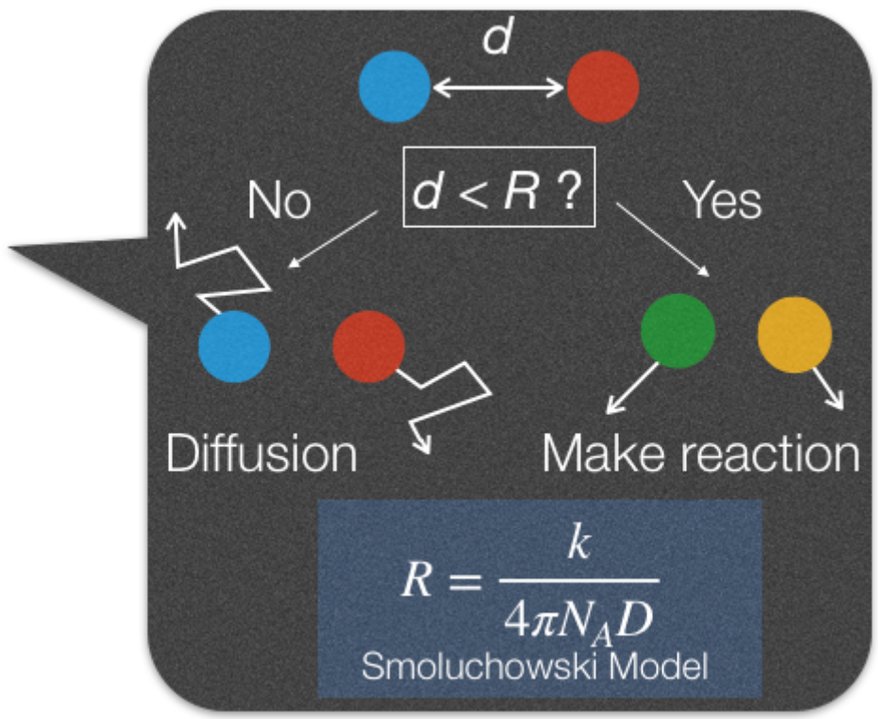
Physico-Chemical Stage

- All processes in Geant4-DNA are implemented in MPEXS-DNA:
  - Dissociation, relaxation, and electron-hole recombination for H_2O^+/H_2O^-, H_2O^* molecules
  - Thermalization for electrons

Electronic state	Process	Dissociation channel	Fraction (%)
Ionization state	Dissociative decay	$H_3O^+ + \bullet OH$	100
Excitation state: A1B1	Dissociative decay	$\bullet OH + H\bullet$	65
	Relaxation	$H_2O + \Delta E$	35
Excitation state: B1A1	Auto-ionization	$H_3O^+ + \bullet OH + e^-_{aq}$	55
	Dissociative decay	$\bullet OH + \bullet OH + H_2$	15
	Relaxation	$H_2O + \Delta E$	30
Excitation state: Rydberg, diffusion bands	Auto-ionization	$H_3O^+ + \bullet OH + e^-_{aq}$	50
	Relaxation	$H_2O + \Delta E$	50
Dissociative attachment	Dissociative decay	$\bullet OH + OH^- + H_2$	100
Electron Hole Recombination	Dissociative decay	$\bullet OH + \bullet OH + H_2$	15
	Dissociative decay	$\bullet OH + H\bullet$	55
	Relaxation	$H_2O + \Delta E$	30

Chemical Stage

- Simulate diffusion and chemical reactions for molecular species from 1 ps to 1 us after irradiation
  - Reactions based on the Smoluchowski theory
  - Molecular diffusion with a ***step-by-step*** method
    - Dynamical time-stepping
    - Calculate encounter probability using the Brownian-bridge method



- Two sets of parameters:
  - G4EmDNAChemistry and G4EmDNAChemistry_option1

Diffusion Coefficients [x10^{-9} m^2/s]

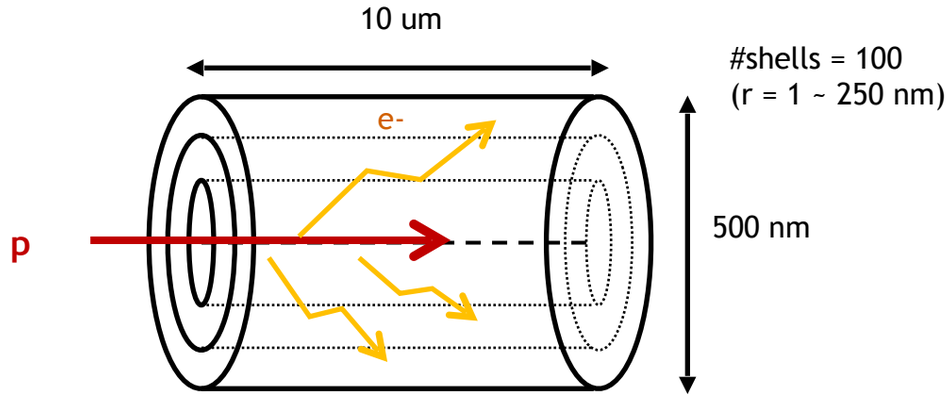
	G4EmDNAChemistry	G4EmDNAChemistry_opt1
H_3O^+	9.0	9.46
H•	7.0	4.8
OH^-	5.0	5.3
e^-_{aq}	4.9	4.9
H_2	4.8	4.8
•OH	2.8	2.2
H_2O_2	2.3	2.3

Reaction Rate Constants [x10^{10}/(M•sec)]

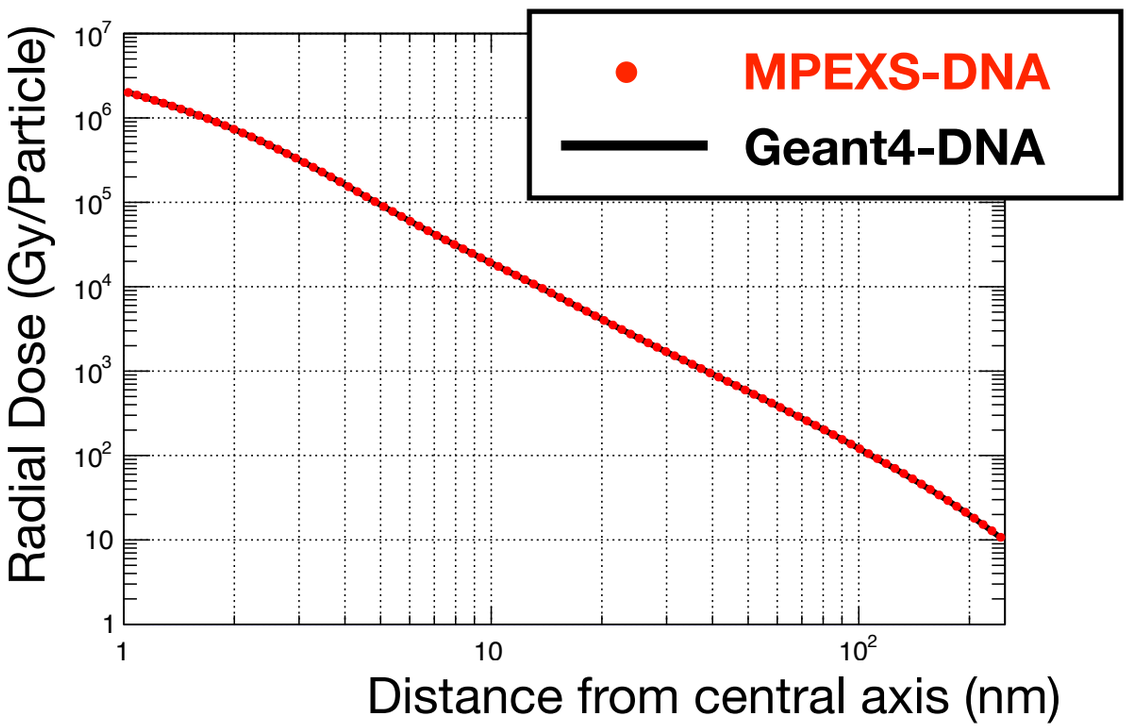
	G4EmDNAChemistry	G4EmDNAChemistry_opt1
$2e^-_{aq} + 2H_2O \rightarrow H_2 + 2OH^-$	0.50	0.636
$e^-_{aq} + •OH \rightarrow OH^-$	2.95	2.95
$e^-_{aq} + H• + H_2O \rightarrow OH^- + H_2$	2.65	2.50
$e^-_{aq} + H_3O^+ \rightarrow H• + H_2O$	2.11	2.11
$e^-_{aq} + H_2O_2 \rightarrow OH- + •OH$	1.44	1.10
$•OH + •OH \rightarrow H_2O$	0.44	0.55
$•OH + H• \rightarrow H_2O$	1.44	1.55
$H• + H• \rightarrow H_2$	1.20	0.503
$H_3O^+ + OH^- \rightarrow 2H_2O$	1.43	11.3

Physics Verification/Validation

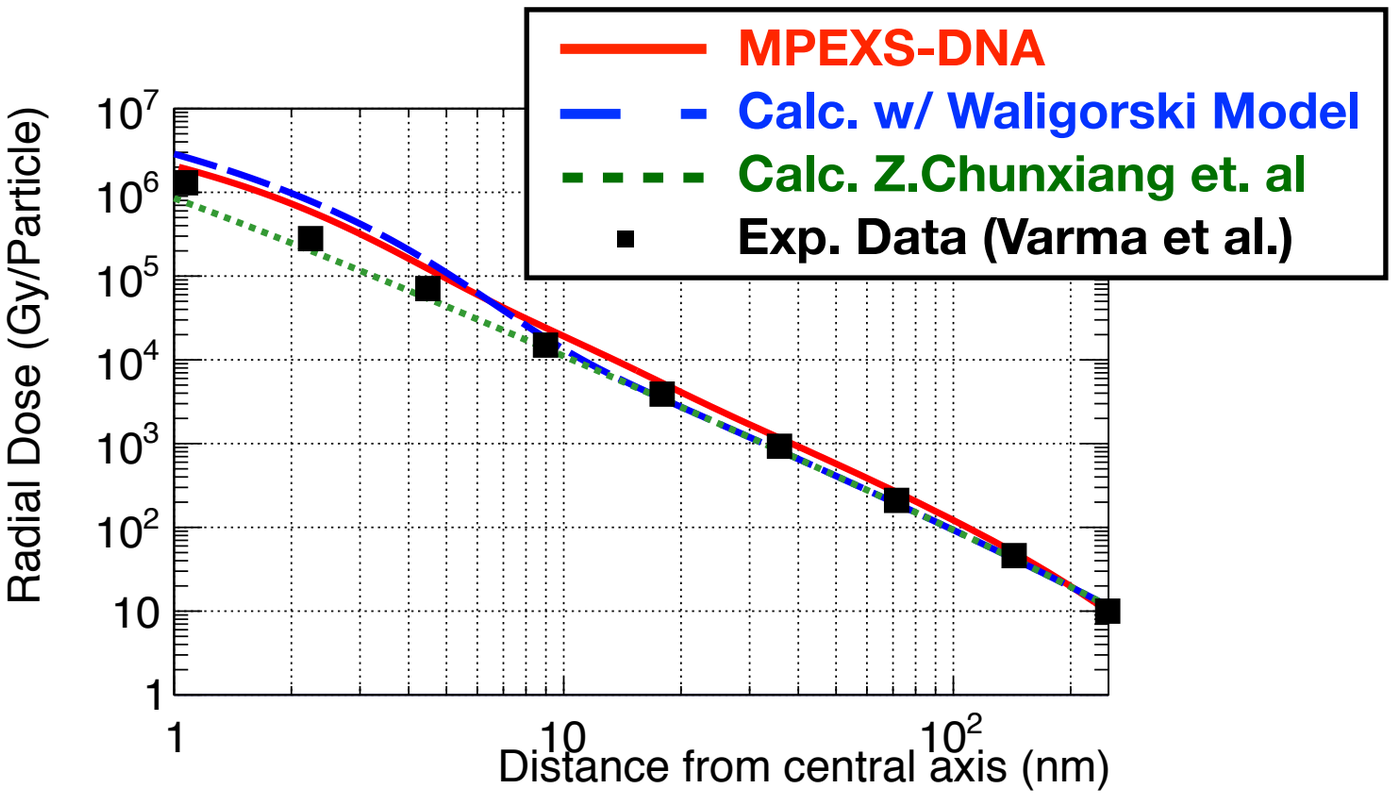
- Compared radial dose distribution of MPEXS-DNA to Geant4-DNA and experimental data
  - Physics List: G4EmDNAPhysics_option4



A: Radial dose distribution:
MPEXS-DNA vs Geant4-DNA
(2.57 MeV/u Oxygen atoms)



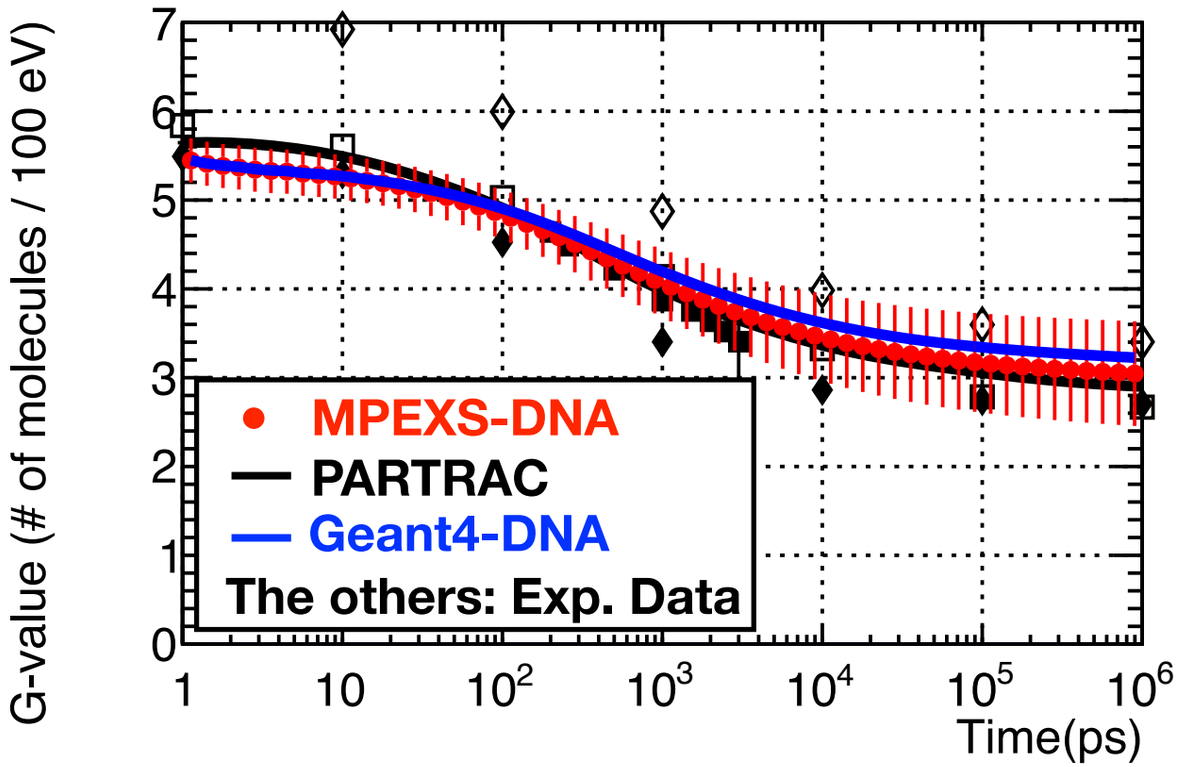
B: Radial dose distribution:
MPEXS-DNA vs measurement data
(2.57 MeV/u Oxygen atoms)



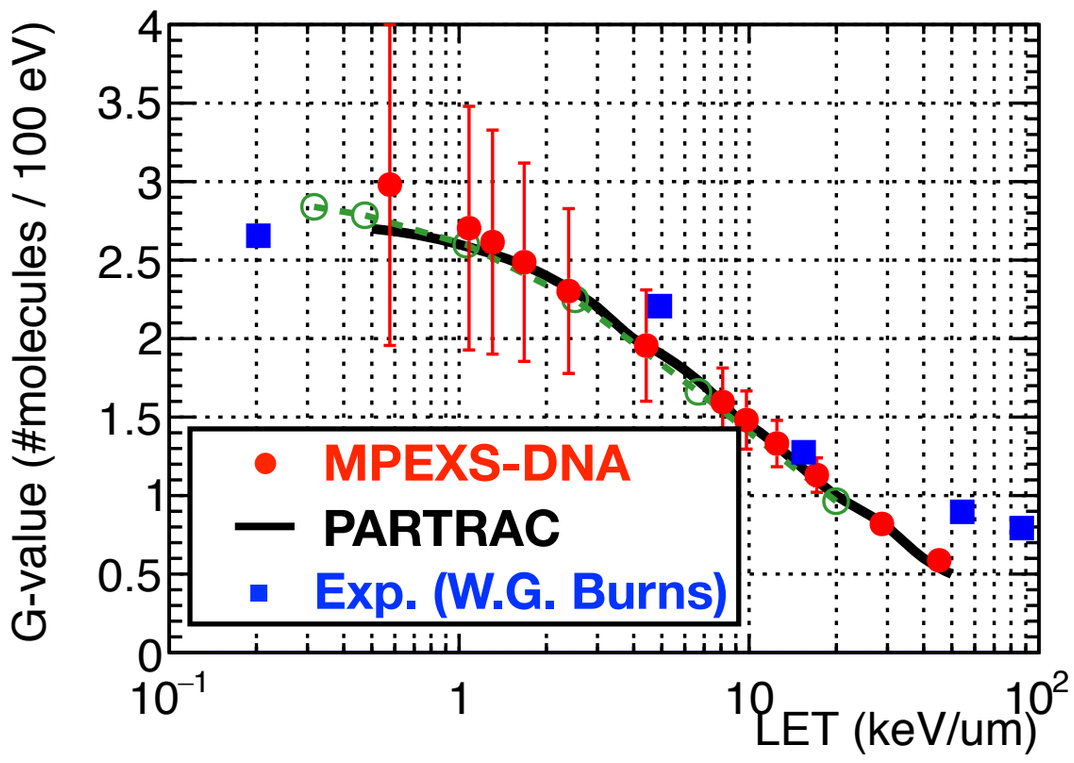
Chemistry Verification/Validation

- Compared G-value plots of MPEXS-DNA to the other MC simulations and measurement data
  - Physics List: G4EmDNAPhysics_option4 and G4EmDNAChemistry

A: G-value time profile for ·OH radicals from 1 ps to 1 μs after irradiation of e⁻



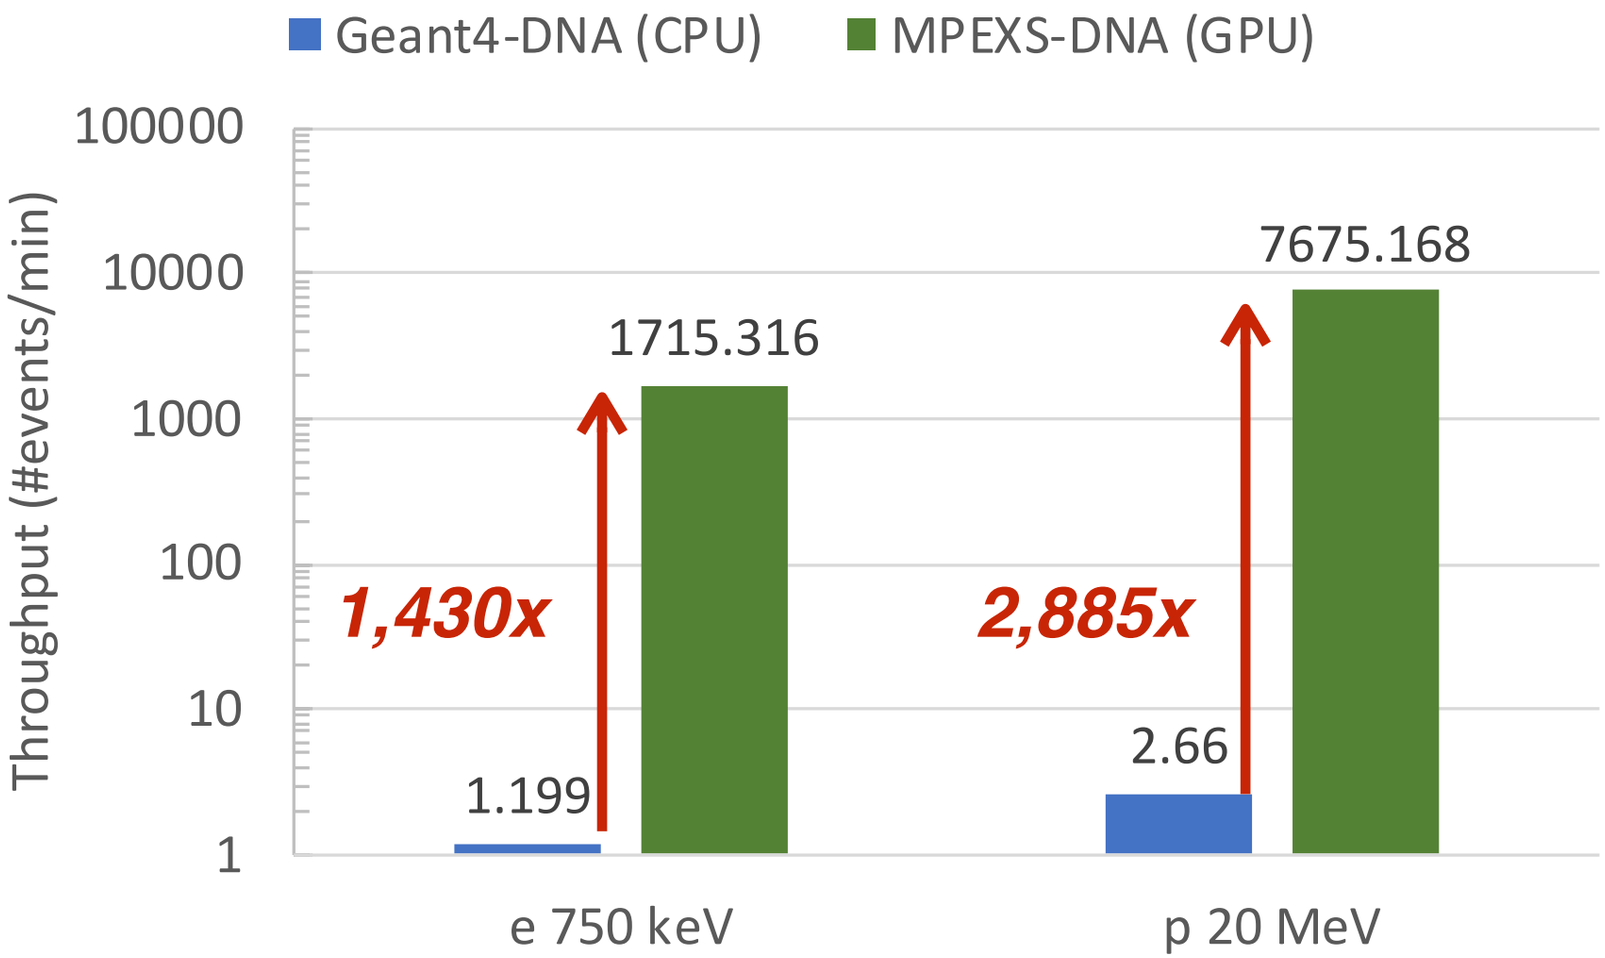
B: LET dependency of G-value for ·OH radicals at 1 μs after proton irradiation



MPEXS-DNA Performance

- Up to **2,900 times** faster than Geant4-DNA with single-core of CPU
  - ~ 4 days (CPU) -> **~ 2 min. (GPU)**
  - **1 GPU unit has the equivalent computing power as 2,900 CPU cores**

Comparisons of event number processed per 1 min.



- GPU: NVIDIA, TITAN V
- CPU: Intel, Xeon E5-2643 v2, 3.5 GHz

MPEXS-DNA Functionalities

	Status
Physics Stage	• Most of physics models in G4DNA can be run • The CPA100 model will be implemented soon

Physico-chemical Stage	• Implemented all processes in G4DNA:
	  • Dissociation, Relaxation, and Electron hole recombination for H_2O^*, H_2O^+/H_2O^-
	  • Thermalization for electrons

Chemical Stage	• Simulate diffusion and reactions with the same manner as G4DNA • Two-parameter sets: G4EmChemistry and G4EmChemistry_option1

Recent activities on Geant4-DNA and MPEXS-DNA

Implementation of An Alternative Model for Chemistry Stage

- **Plante's approach**
  - Ref.) I. Plante, DOI: 10.1007/s00411-011-0367-8
  - Based on the Smoluchowski theory for reactions
    - Handling electrostatic interactions and spin effects
    - Computing encounter probability by solving the diffusion equation with Green's function
  - Simulating reactions with homogeneously high-concentrated species
    - ex. radical scavengers

Radiat Environ Biophys (2011) 50:389–403
DOI 10.1007/s00411-011-0367-8

ORIGINAL PAPER

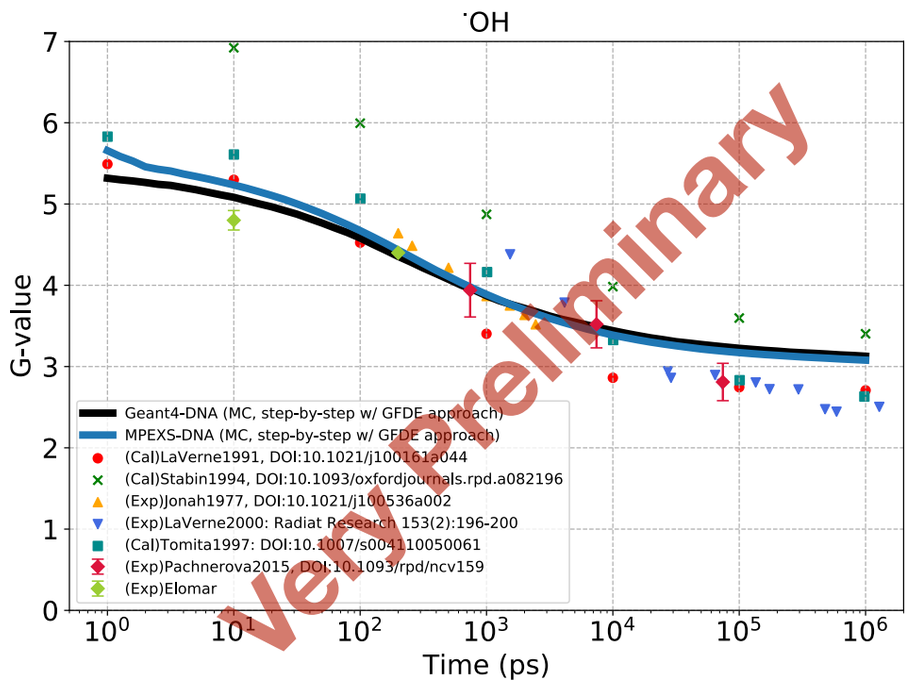
A Monte–Carlo step-by-step simulation code of the non-homogeneous chemistry of the radiolysis of water and aqueous solutions. Part I: theoretical framework and implementation

Ianik Plante

- **Implementation of Plants's approach in MPEXS-DNA**
  - Diffuse molecules ***step-by-step*** by Brownian motion
    - Adopting static time-stepping
  - Implemented using G4DNA (10.5 and 10.6 beta) tentatively

- **Plante's approach with *IRT* for Geant4-DNA**
  - Developing by Wook (CENBG) and Hoang (IRNS) with the support from Jose (UCSF)

G-value time profile for •OH radicals from 1 ps to 1 *μ*s after irradiation of 750 keV electrons



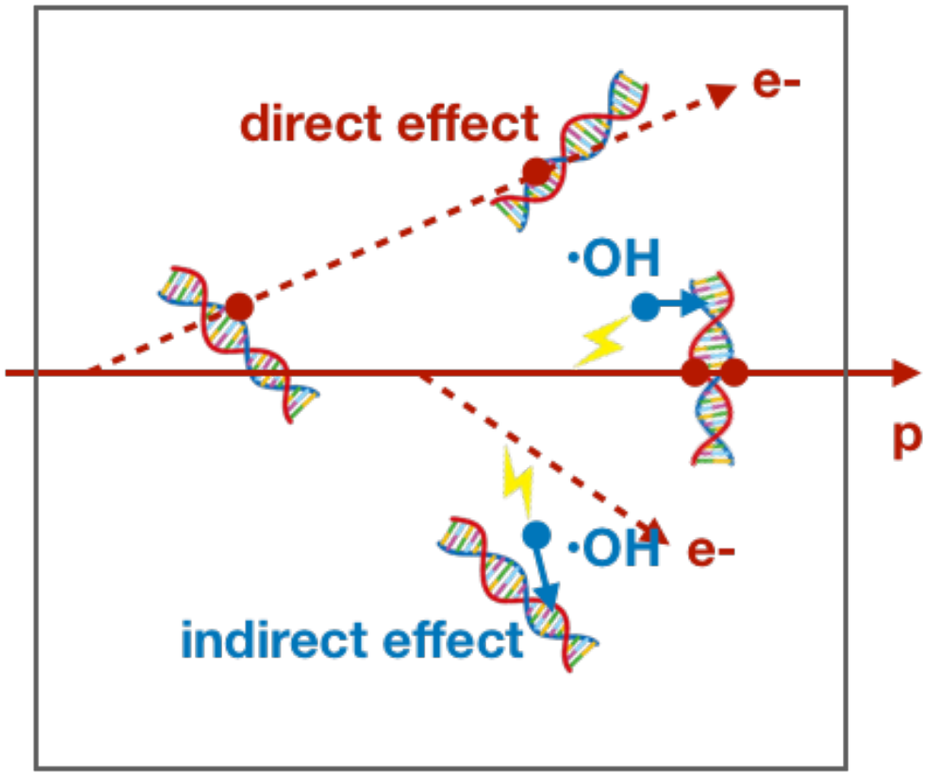
Estimation of DNA Damages

- Geant4-DNA calculates early radiation damages using a complex geometry of the cell nucleus
  - Process flow:
    1. Calculate distributions of energy loss and molecular species
    2. Score the positions at which physical and chemical interactions occurred with DNA molecules in a cellular geometry
    3. Evaluate DNA damages with higher geometrical accuracy
  - Reproduce experimental data and the other simulation results well

- We are trying to estimate DNA damages with an alternative approach
  - Simple cell model for geometry
  - Clustering model for DNA damages

Quantitative Estimation of DNA Damage Using Clustering Model

- *"clustering"*: An extended example for Geant4-DNA
  - Evaluates DNA damage induced by direct effects
  - Ref.) DOI:10.1016/j.cmpb.2010.12.012



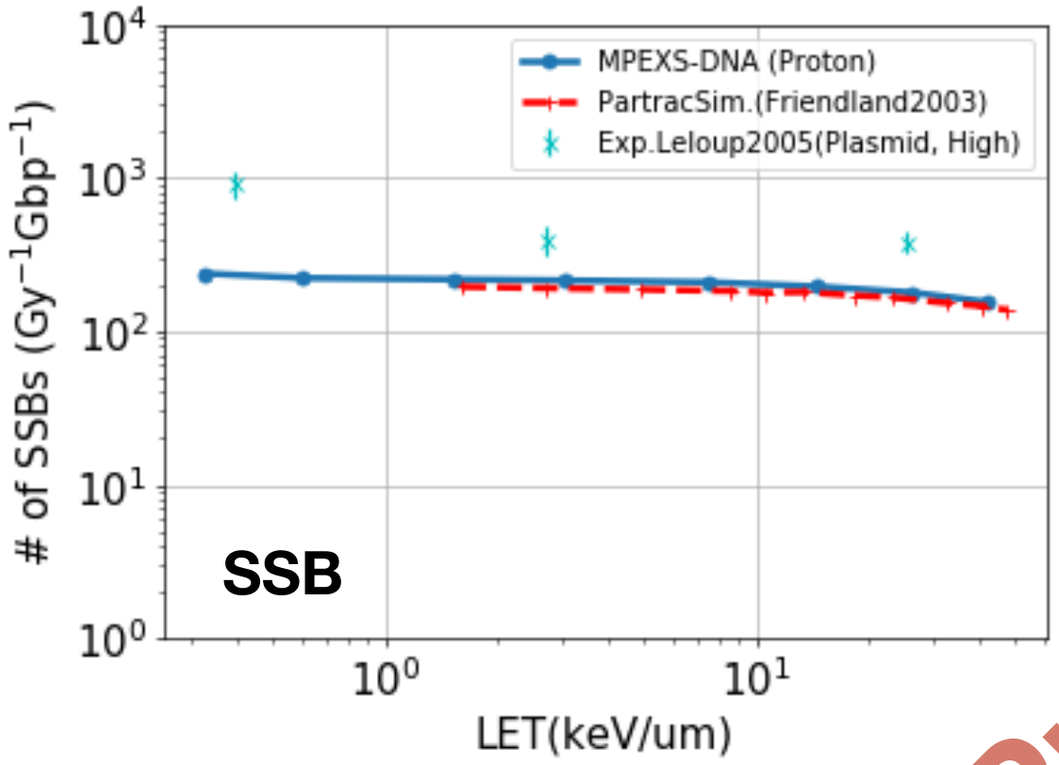
- We extend the *"clustering"* application
  - Estimate DNA damages by ***indirect effects*** as well as direct effects

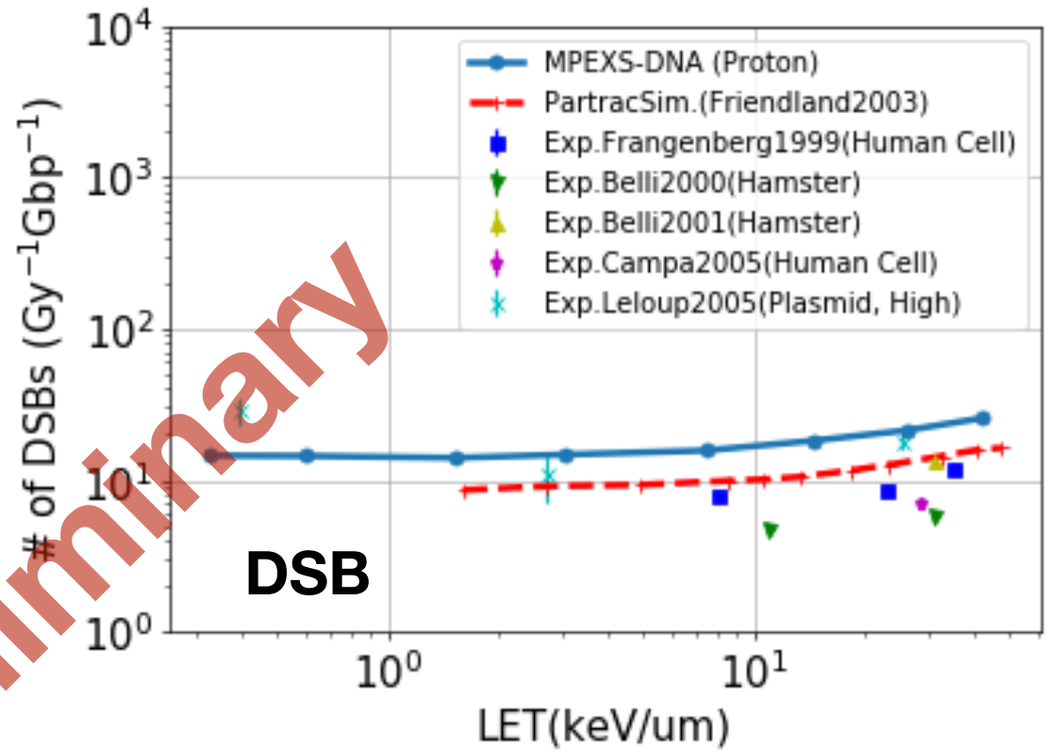
- Assume that DNA molecules are homogeneously diluted in a box geometry (Simple cell model)

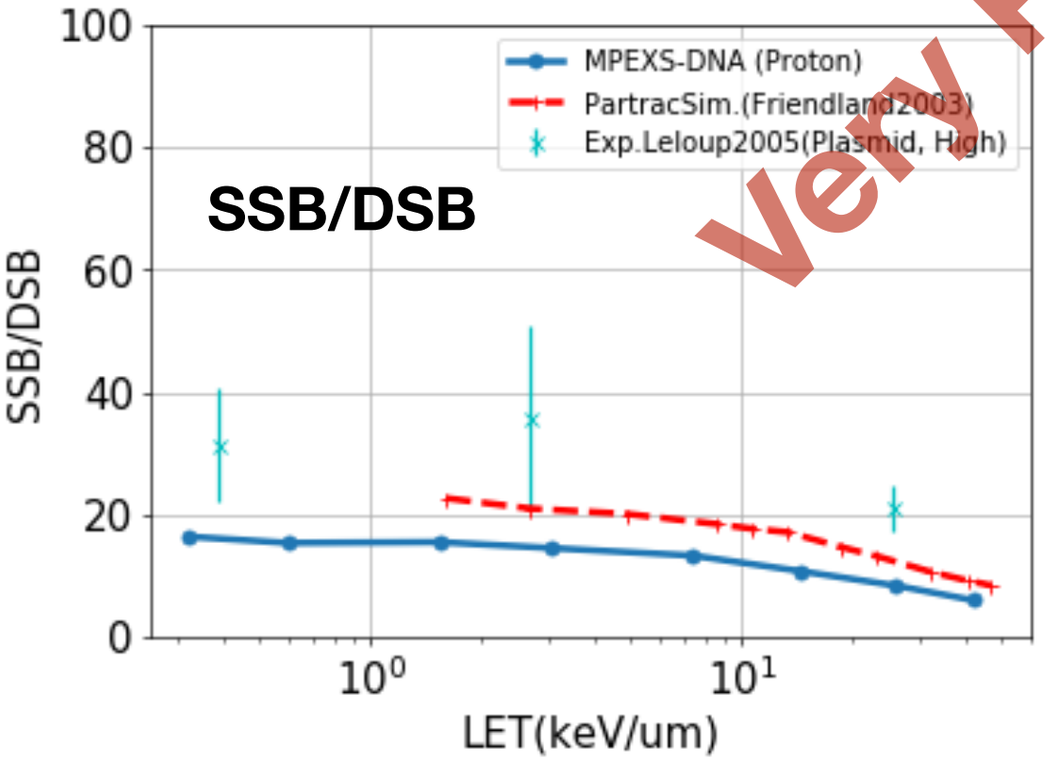
  - Simulate track structure of charged particles and molecular species
    - Using the Plante's approach for chemistry simulation

  - Sample the positions at which physical and chemical reactions with DNA components occur, then evaluate DNA damages

Damage Estimation for Proton Irradiation







- Primary particles
  - Protons with E_{kin} = 500 keV - 100 MeV
- Reasonable agreement with the experimental data and the PARTRAC results

Future Plans

- **Extending functionalities in MPEXS-DNA for nanodosimetry simulations**
  - More complex geometry exported from CAD
    - ex. DNA double helix structure

  - Various materials other than water (ex. DNA components)
  - Multi-GPU simulations on Cloud services / Supercomputer
    - **“Almost infinite”** scalability
      - ex. 27,648 GPUs (TESLA V100) @ Summit
    - MPEXS-DNA will pioneer a scientific frontier in raidobiology
      - Better understanding mechanism of DNA damages
      - More precise estimation of effects on chronic radiation exposure
        - ex. Astronauts, Airline crew, medical diagnostic, …
      - Quicker development of next-generation radiotherapy technique
        - ex. Flash radiotherapy
      - …

→ **Further developments are continuing**

Summary

- MPEXS-DNA is a nanodosimetry simulator based on Geant4-DNA running on GPU
    - Most of functionalities in Geant4-DNA are available
    - A paper on MPEXS-DNA was published from Medical Physics
        - DOI: 10.1002/mp.13370

- Recent activities:
    - Implemented Plante's approach with a step-by-step method in Geant4-DNA and MPEXS-DNA as an option of chemistry simulation

    - Quantitative estimation of radiation damages of DNA molecules with a simpler approach
        - Simple cell model / clustering model
        - Reasonable agreement with the measurement data

    - These developments will be delivered soon in both MPEXS-DNA and Geant4-DNA
    - MPEXS-DNA also boosts the development of Geant4-DNA

- MPEXS-DNA pioneers a new promising frontier in radiobiology!

MPEXS License Model

- Two models:
  - Collaboration license
    - Only for groups who expect to submit a paper jointly within 1 year
    - Free of charge
    - The newly earned intellectual properties in the collaboration are requested to be donated to KEK or to be put in the public domain
      - Also shall not exercise the moral rights of the author or any other similar rights
  - General license
    - Contracts with KEK are required
    - A license fee will be requested

MPEXS-DNA Physics Processes
