Elastic scattering of p-halo ${}^8\text{B}$ beam close to the Coulomb barrier

Friday 6 December 2019 14:00 (15 minutes)

In this contribution, preliminary results of the experiment IS616 will be presented. The aim of the experiment was to investigate on the reaction dynamics of proton-halo induced collisions at energies around the Coulomb barrier where coupling to continuum effects are expected to be important. The elastic scattering ${}^8\text{B} + {}^{64}\text{Zn}$ angular distribution was measured, for the first time, using the GLORIA Si-strip detector array placed in the SEC scattering chamber. The low beam intensity hindered the possibility to measure $\text{p} - {}^7\text{Be}$ coincidences coming from break-up processes. Singles events have, however, been measured.
