Monte Carlo Simulations of Semiconductor Detectors

- Using Monte Carlo methods to describe detector response is not new
- Creation & proliferation of many different codes for detector simulation:
 - Experiment-specific
 - Specialized on specific detectors
 - Inclusion only of effects relevant to that one simulation
 - Written as part of a PhD thesis, abandoned afterwards
- **Wanted:**
flexible, tested & supported MC simulation software...

Midjourney,
/image a silicon pixel detector
measuring high-energetic particles

The Allpix² Framework

- Development of new framework started within **CLICdp Collaboration**
- Now 6 years of development with
 - 44 releases, current version 2.3.3
 - 3 user workshops
 - > 50 code contributors

Development based on four principles:

- I. Integration of Existing Toolkits
- II. Well-Tested & Validated Algorithms
- III. Low Entry Barrier for New Users
- IV. Clean & Maintainable Code

I. Integration of Existing Toolkits

Many very powerful tools developed and employed over decades of detector R&D
Leverage their capabilities by providing interfaces for their integration

Geant4 – simulating interactions of particles passing through matter

- Detailed simulation of many interactions & processes
- Cumbersome to use for beginners, complexity often overwhelming at first
- Provide abstraction layer to auto-generate models and run simulation

TCAD – solving Poisson's equation using finite element methods

- Detailed understanding of field configuration, sensor behavior
- Tools & knowledge widely spread in community
- Provide possibility to import results to complement MC simulations

II. Well-Tested & Validated Algorithms

Simulations provide insights into physical processes – but only if they model them correctly!

- Validation of algorithms is a crucial and time-consuming process
- **User workshops** for exchange of the community, discussions, planning...

- Validating as much as possible against data
- Publishing reference studies including full simulation configuration used
- Providing automated tests for every new feature

ALPIS² is a modular simulation framework for silicon detectors. It is designed to be used in the development of digital detectors for high energy physics experiments. The framework is built on top of the Geant4 simulation toolkit and provides a high-level interface for the simulation of silicon detectors. It is designed to be used in the development of digital detectors for high energy physics experiments. The framework is built on top of the Geant4 simulation toolkit and provides a high-level interface for the simulation of silicon detectors.

ARTICLE INFO

ABSTRACT

ALPIS² is a modular simulation framework for silicon detectors. It is designed to be used in the development of digital detectors for high energy physics experiments. The framework is built on top of the Geant4 simulation toolkit and provides a high-level interface for the simulation of silicon detectors.

1. Introduction

Detailed simulations of segmented silicon detectors are a crucial part of the design and optimization of digital detectors for high energy physics experiments. The framework is built on top of the Geant4 simulation toolkit and provides a high-level interface for the simulation of silicon detectors.

2. Framework architecture

ALPIS² is built as a modular framework which separates model development from the simulation of the detector. The framework is built on top of the Geant4 simulation toolkit and provides a high-level interface for the simulation of silicon detectors.

ALPIS²: Recent Developments and Applications. This paper describes the recent developments and applications of the ALPIS² framework. The simulation is performed using Geant4 and Monte Carlo methods.

Abstract

ALPIS² is a versatile, open-source simulation framework for silicon pixel detectors. It is designed to be used in the development of digital detectors for high energy physics experiments.

1. Introduction

ALPIS² is a versatile, open-source simulation framework for silicon pixel detectors. It is designed to be used in the development of digital detectors for high energy physics experiments.

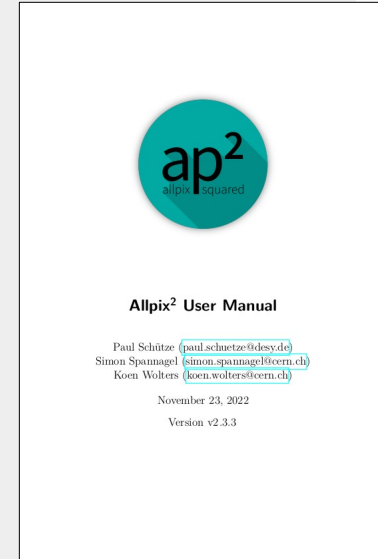

In preparation...

III. Low Entry Barrier for New Users

Simulation frameworks often very complex:
code complexity, lack of documentation, physics

- Allpix Squared attempts to facilitate quick starts:
 - Extensive documentation / [user manual](#)
 - [Public forum](#) for help & exchange
 - Human-readable configuration files
 - Support for physical units
 - No coding or code-reading required
- Successfully used e.g. in university education, summer schools, ...

IV. Clean & Maintainable Code

Collaborative software development requires well-defined procedures –
 Otherwise quickly becomes unmaintainable

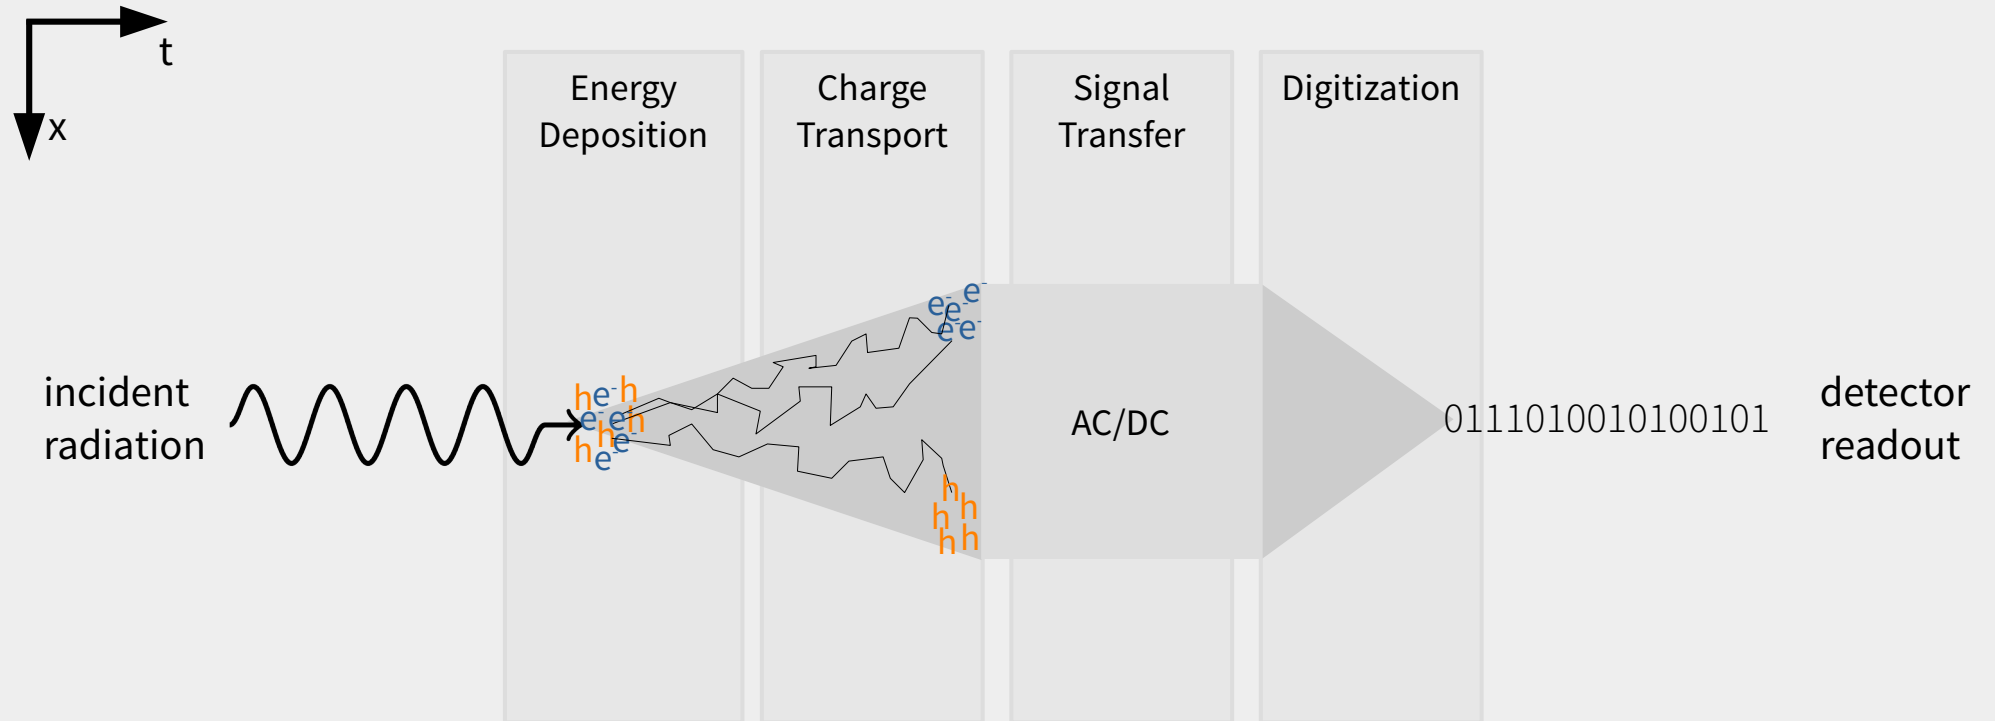

Allpix Squared implements *best practices* for software development

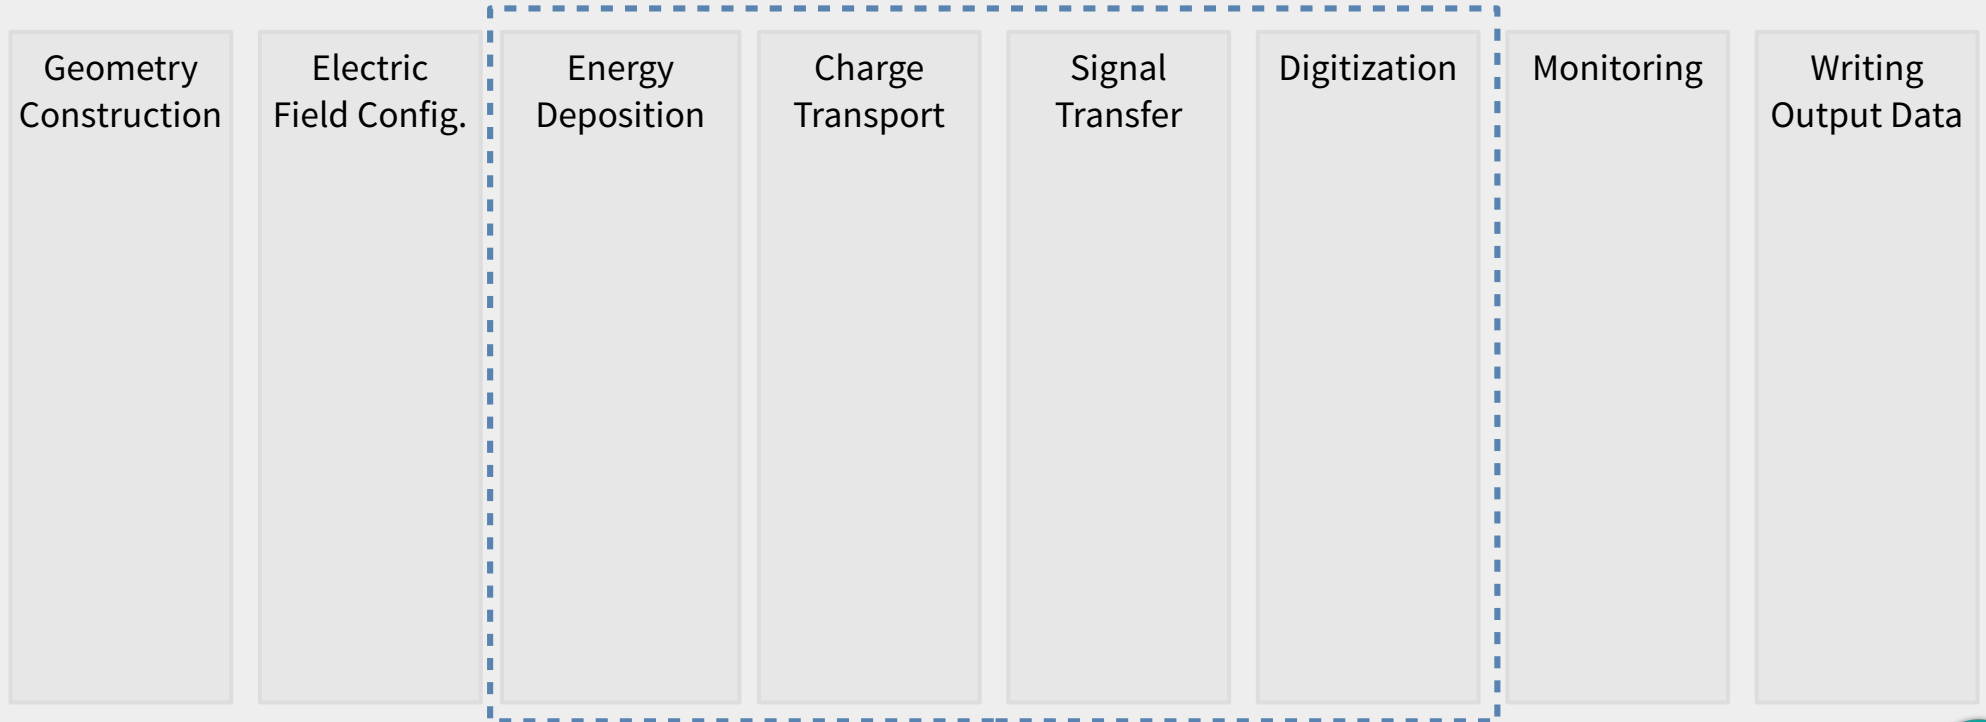

- Permissive MIT open-source license
- Semantic versioning (major.feature.patch)
- Extensive code reviews via merge requests
- Strict enforcement of coding conventions & formatting
- Regular static code analysis
- Following C++17 Standards

Particle Detection with Semiconductor Detectors

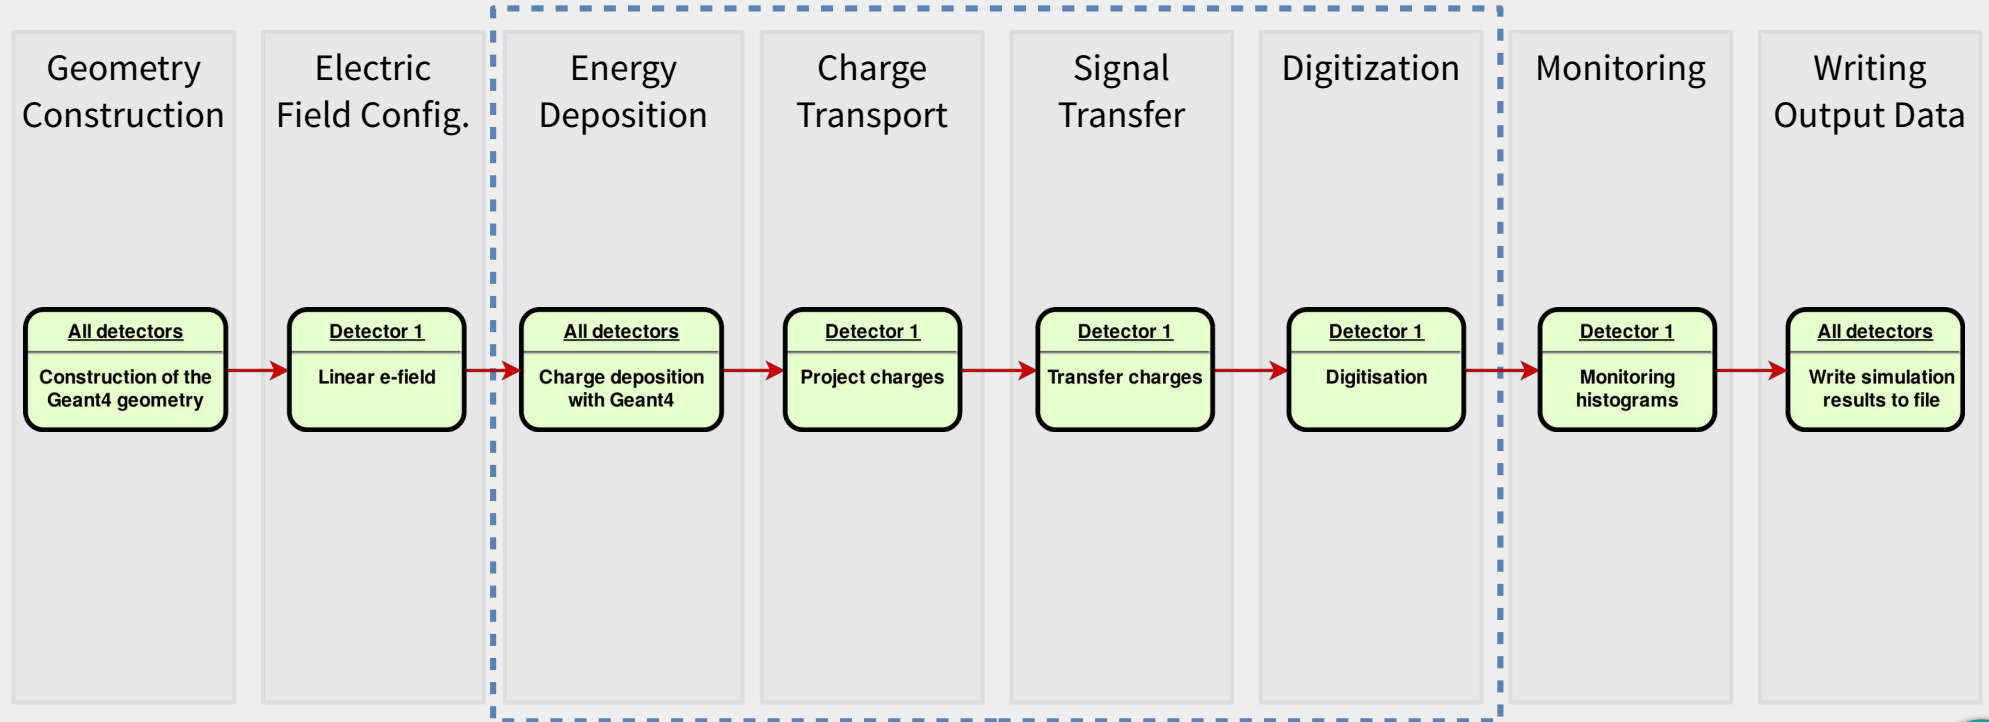

The Simulation Chain

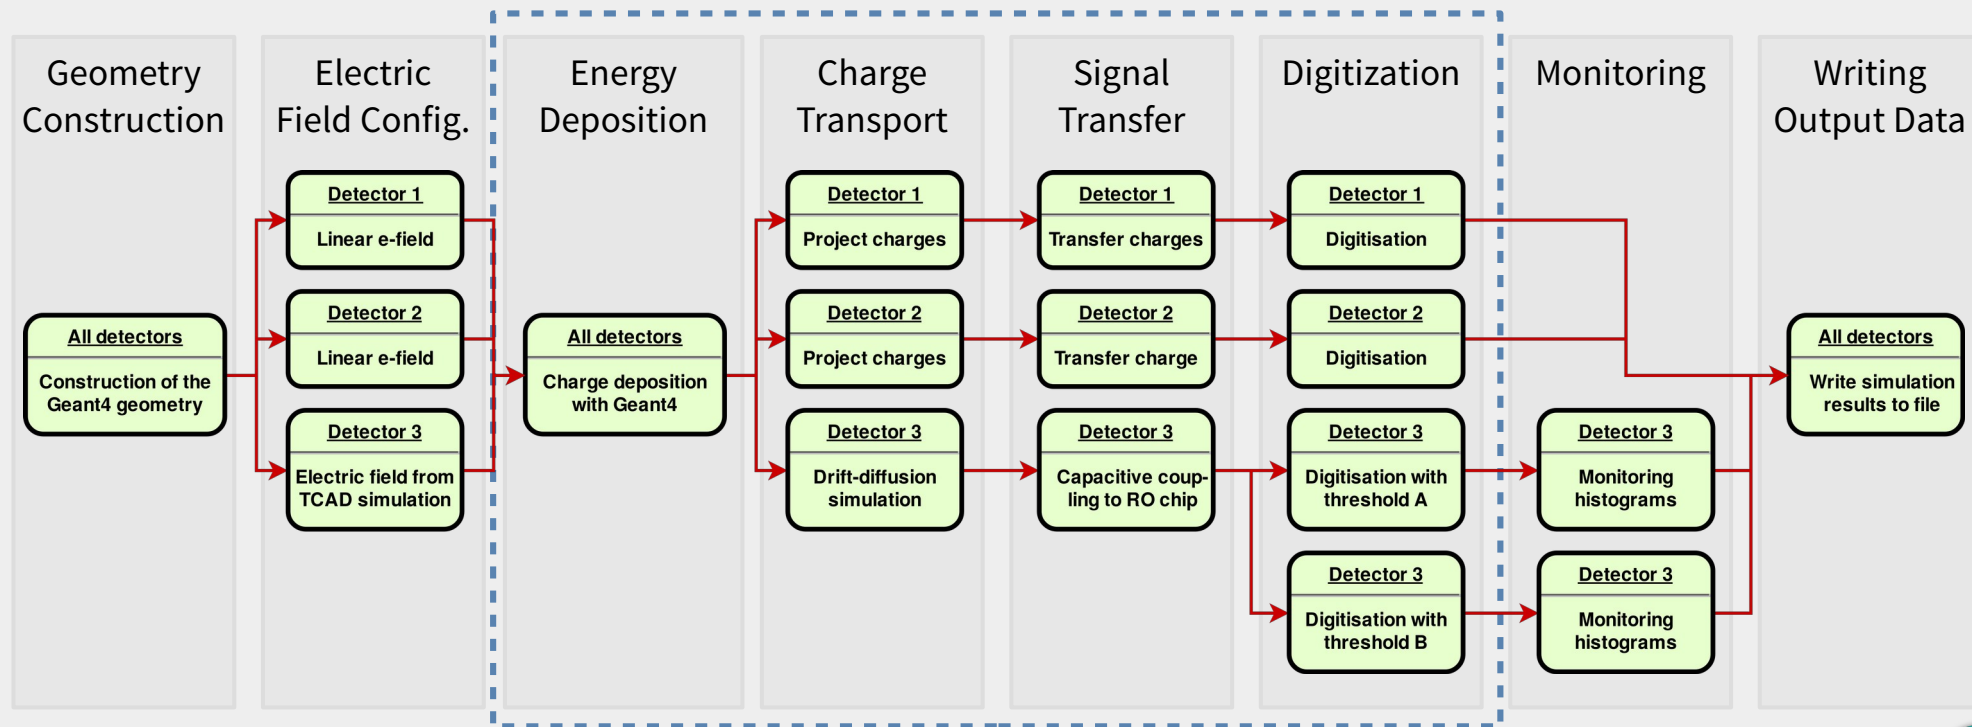

The Simulation Chain

- Building blocks follow individual steps of signal formation in detector
- Algorithms for each step can be chosen independently

The Simulation Chain

- Simulation very flexible: modules configurable on per-detector level
- Multiple instances can be run in at the same time (e.g. to simulate different front-ends)

Application Examples

MAPS Sensors, PET Scanners, Neutron Imaging

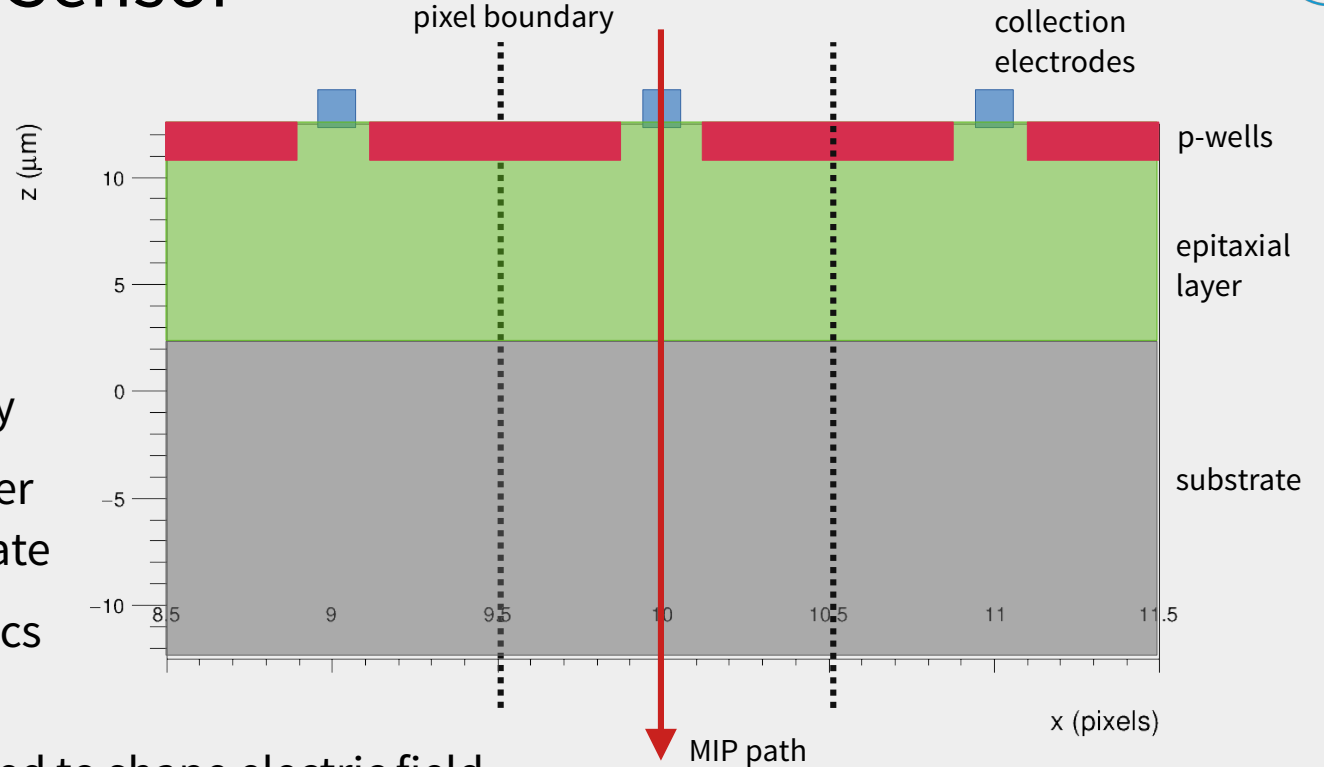

Simulating a MAPS Sensor

MAPS sensors are complex...

Example:

- Small-electrode sensor in CMOS Imaging technology
- High-resistivity epitaxial layer on electronics-grade substrate
- Deep wells protect electronics circuit from sensor field
- Additional implantations used to shape electric field

Simulating response to minimum ionizing particle incident perpendicular to surface

Simulating a MAPS Sensor – Simplistic Approach

- Applying linear electric field
 - Bias voltage -1.2 V
 - Depletion depth 10 μm
- Carrier mobility:
 - Canali model
 - Integrating for 50 ns

- Diffusion dominant in undepleted volume
- Linear drift of charge carriers towards sensor surface, no drift to electrodes
- Large charge cloud, significant signal contribution from substrate

■ electrons
■ holes

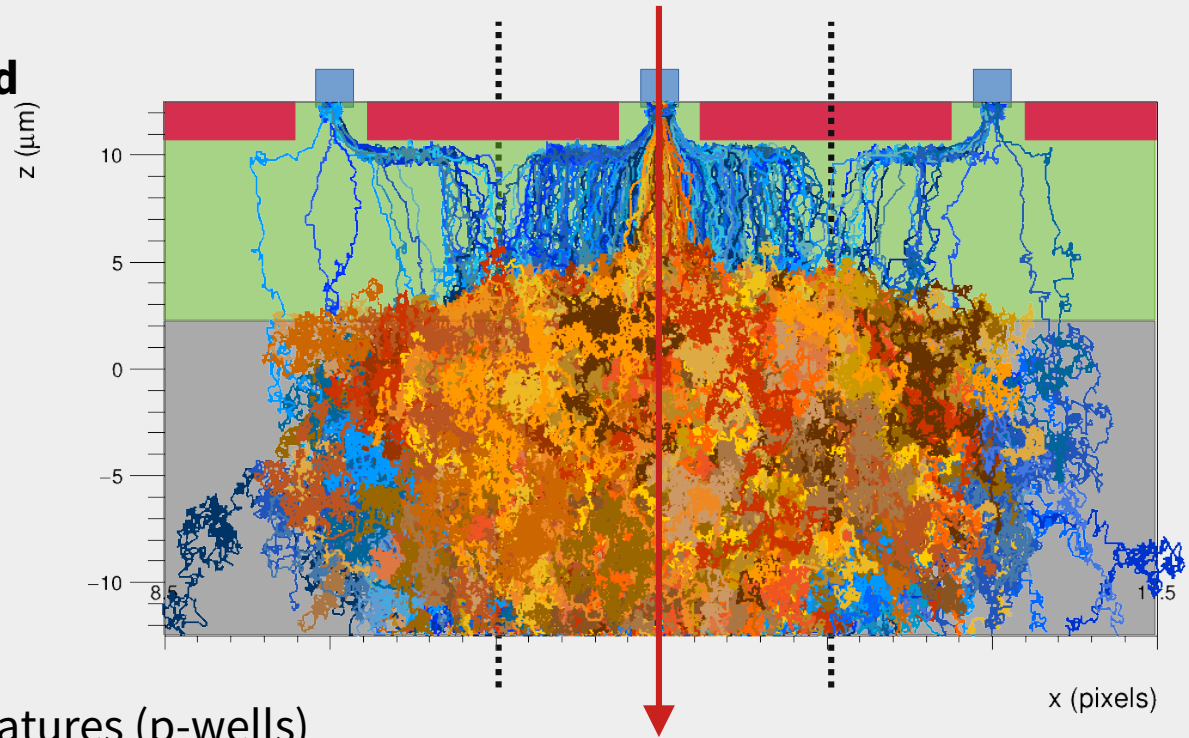

Simulating a MAPS Sensor – The Electric Field

- Applying **TCAD electric field**

- Bias voltage -1.2 V
- Depletion depth 10 μm

- Carrier mobility:

- Canali model
- Integrating for 50 ns

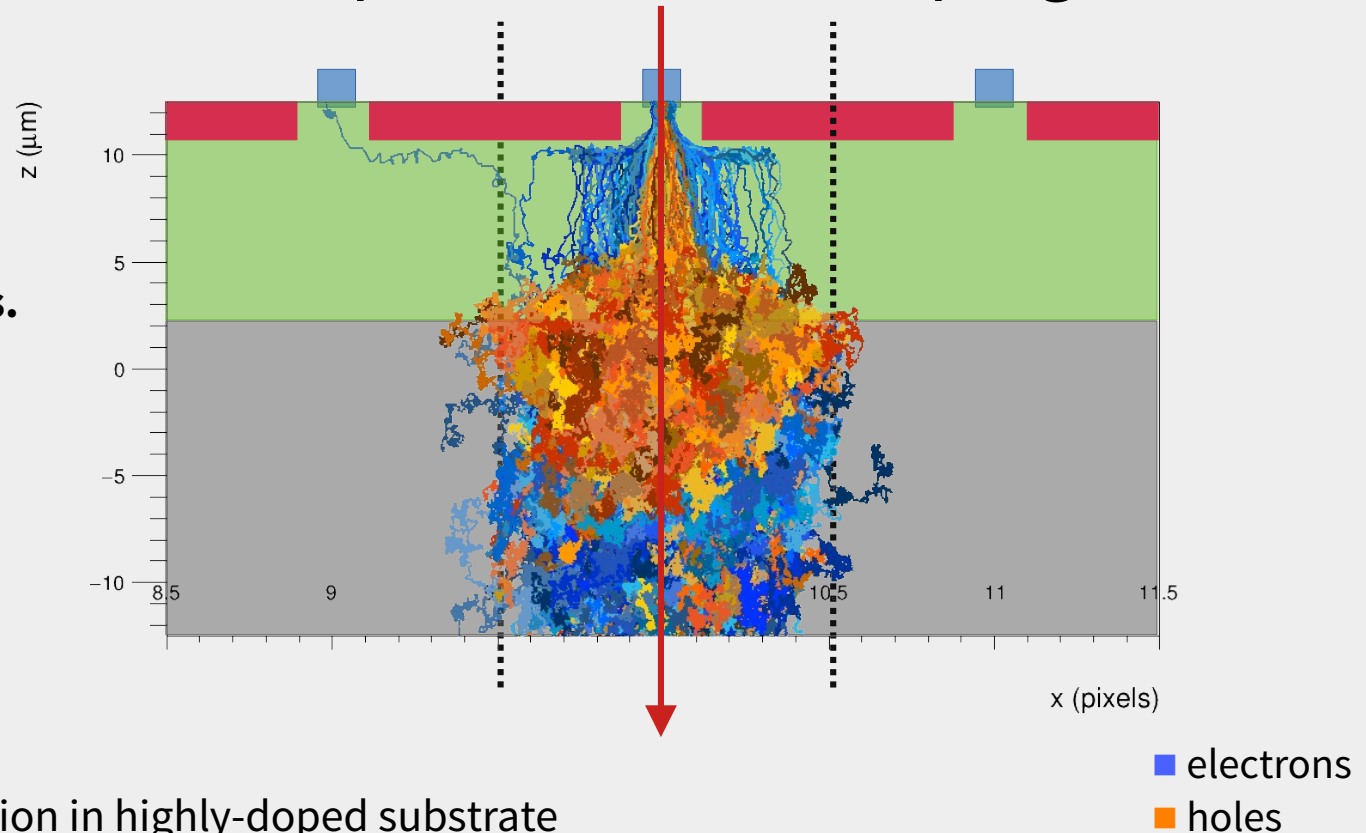

- Carrier drift obeys sensor features (p-wells)
- Collection at electrodes
- Still signal contribution from substrate

■ electrons
■ holes

Simulating a MAPS Sensor – Epi & Substrate Doping

- Applying TCAD electric field
 - Bias voltage -1.2 V
 - Depletion depth 10 μm
- Setting **doping for epi & subs.**
- Carrier mobility:
 - **Masetti-Canali** model (doping dependent)
 - Integrating for 50 ns

- Significant reduction of diffusion in highly-doped substrate
- Less charge sharing from substrate contributions

Simulating a MAPS Sensor – Carrier Lifetime

- Applying TCAD electric field
 - Bias voltage -1.2 V
 - Depletion depth 10 μm
- Setting doping for epi & subs.
- Carrier mobility:
 - Masetti-Canali model (doping dependent)
 - Integrating for 50 ns
- **Recombination:**
combined SRH-Auger model

- Significant reduction of substrate contributions due to short lifetime in high-doping volume

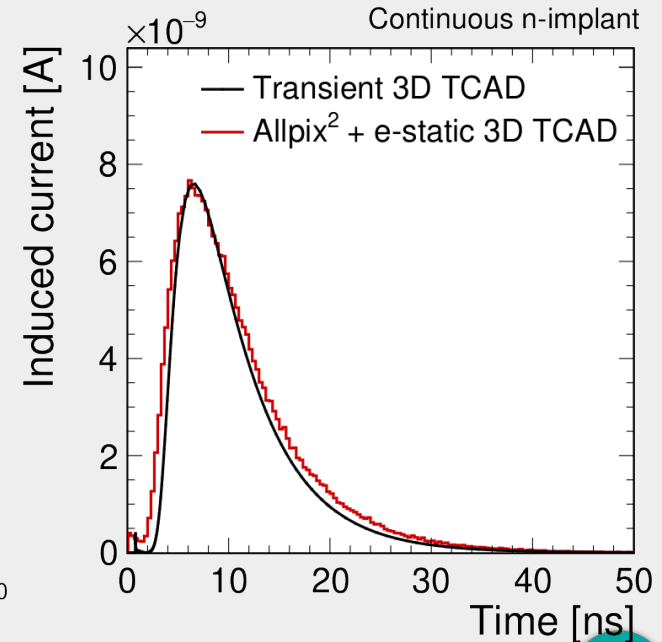

Comparison with Testbeam Data

NIMA 1031 (2022) 166491
doi:10.1016/j.nima.2022.166491

- CLICTD prototype for CLICdet tracking detector
- Validation of MC simulation with data recorded at DESY II Testbeam

- Excellent match of position resolution as function of threshold
- Comparison of TCAD transient simulation with Shockley-Ramo MC simulation
 - Very good match, also across different sensor designs

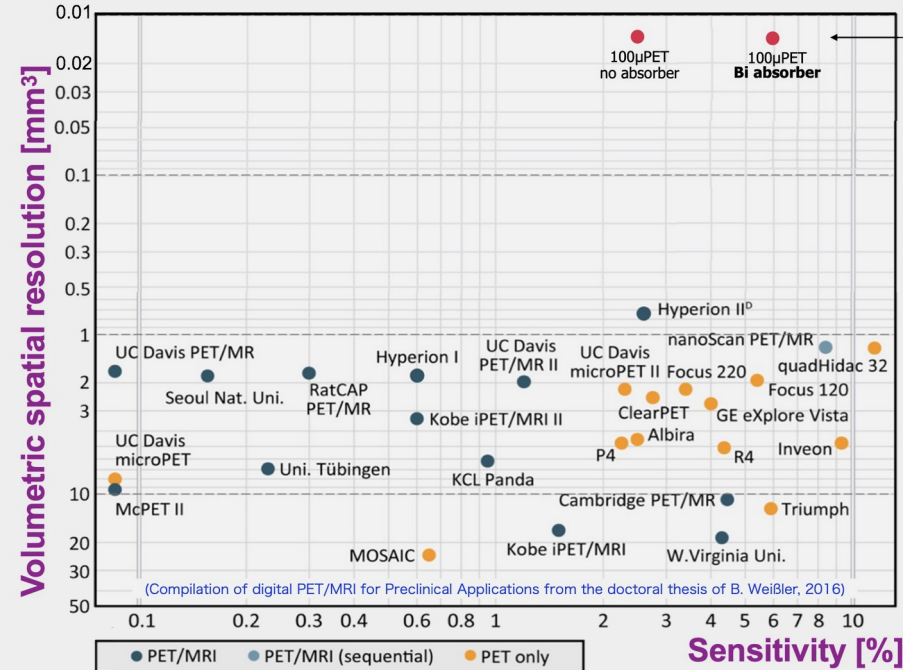

The 100 μ PET Project

New generation of PET scanners for high-res. molecular imaging

- 4 Sectors, each 60 detection layers, monolithic Si sensors
- Layer of 250 μ m active silicon, 20 μ m SiO₂, 200 μ m Kapton, 50 μ m Bi

Jihad Saidi,
Mateus Vicente

Simulating the 100 μ PET Scanner

Jihad Saidi,
Mateus Vicente

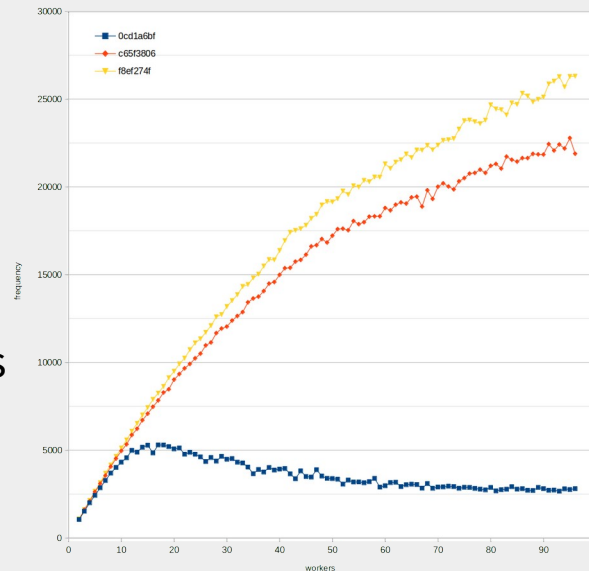

- Simulating full setup with Allpix Squared
 - Script to generate geometry setup
Placement of sensors, support, absorbers
 - Interaction from Geant4 module:
Positron annihilation and MFP, Photon Interactions
 - Charge carrier propagation
 - Electronics response
(pixel threshold 10 keV)
 - Clustering
- Custom particle sources:
images to simulate realistic phantoms
- High-rate event generation for
"realistic data-sets" with $\sim 10^9$ events

De Renzo Phantom

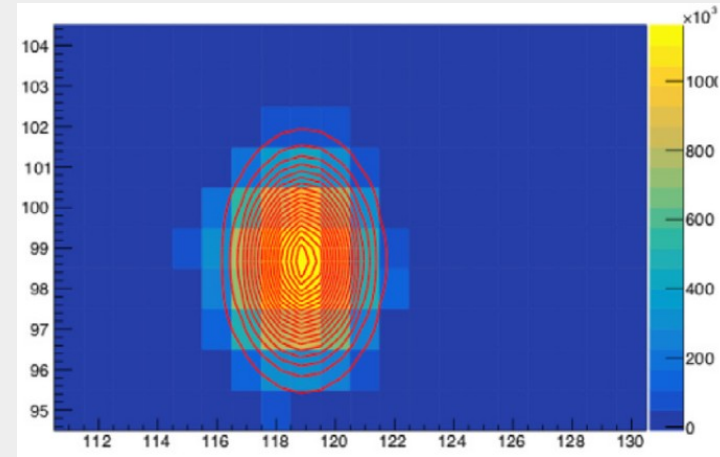

Iterative + sensitivity-corrected

Machine Learning for Neutron Position Resolution

- High spatial resolution of ultracold neutron (UCN) measurements is crucial for several experiments involving UCNs such as quantum physics and quantum gravity
- Previous work uses a 2D Gaussian fit to determine hit position
- **Goal:** use machine learning and Allpix Squared to predict hit position while accounting for detector physics

2D gaussian fitted to a UCN hit

Module& operator=(const Module&) noexcept = delete;
```

Other Semiconductor Sensor Materials

Allpix² Silicon Semiconductor Detector Simulation Framework

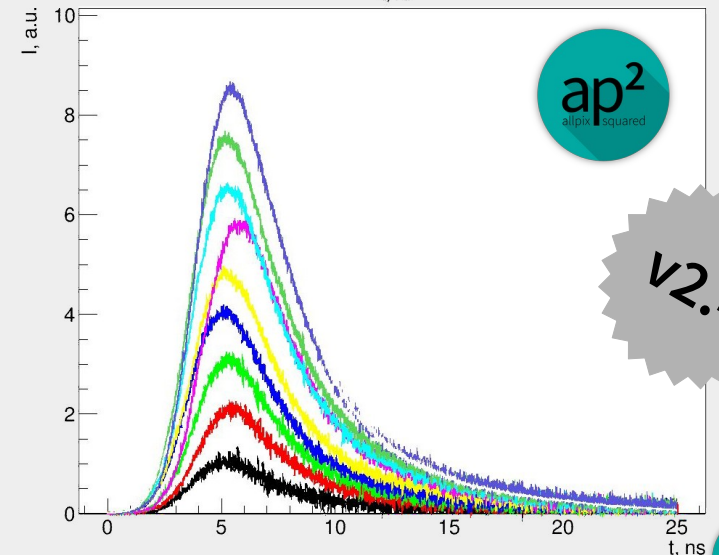

- Selection of sensor material in det. model
- Definition of sensor materials impacts ...
 - Material in Geant4 geometry
 - Charge carrier creation energy default
 - Fano factor default
 - Mobility model, recombination, ...
- Benchmark simulation using GaAs:Cr sensors show very good agreement

Material	Charge Creation Energy [eV]	Fano factor	Sources
Silicon	3.64	0.115	[25], [26]
Germanium	2.97	0.112	[27]
Gallium Arsenide	4.2	0.14	[28]
Cadmium Telluride	4.43	0.24	[29], [30]
Cadmium Zinc Telluride Cd _{0.8} Zn _{0.2} Te	4.6	0.14	[31], [32]
Diamond	13.1	0.382	[33], [33]
Silicon Carbide (4H-SiC)	7.6	0.1	[34], [35]

Simulation of TCT & Lasers

- Simulate interaction of visible/near-IR light with sensors
- Implemented as separate deposition module
- Pulse with individual photons generated over time
- Penetration depth, refraction simulated, different beam geometries & wavelengths possible:

V2.4

Simulation of 3D Sensors

- Definition of per-pixel implants via detector model
 - Position with respect to pixel center
 - Shape & orientation
 - Material
 - front/backside
- Add as many implants as required, syntax similar to support layers (PCB etc)
- Collision detection of charge carriers with implants; motion stops immediately at implant border
- First simulations with ATLAS 3D sensor geometry
 - Two central front-side columns (collect charge)
 - Six Ohmic backside contact columns

V3.0

single pixel,
top projection of 3D drift

Hexagonal Pixel Geometries

V3.0

Katharina Dort,
Paco Iguaz-Gutierrez,
Ryuji Moriya,
Tasneem Saleem

Extension of geometry subsystem to enable simulation of different pixel shapes & matrix arrangements

- Hexagonal geometry interesting for many applications
 - Avoid problematic field regions in corners (issues with electric fields, charge sharing between 4 pixels, ...)
 - Symmetry more close to circle – more uniform response
- Implementation using **axial coordinate system**
- Support for “pointy” & “flat” hexagon orientation, regular (same-pitch) and distorted (different pitch) hexagons

Other geometries also implemented (e.g. radial strips @ ATLAS ITk)

Summary

ap²
allpix squared

Summary

- Semiconductor Detector Monte Carlo simulations: vital component of understanding & interpreting detector performance
- Allpix Squared:
 - comprehensive MC simulation framework for semiconductor detectors
 - integrates existing toolkits
 - provides validated algorithms
 - is easy-to-get-started and well documented
- Used in many areas within & outside of particle physics
- Continuous development and support, many new features already underway

Use, spread, contribute!

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under Grant Agreement No 101004761.
