

PUTTING A SPIN ON TOP-EFT

Ethan Simpson

X NExT Workshop
March 2021

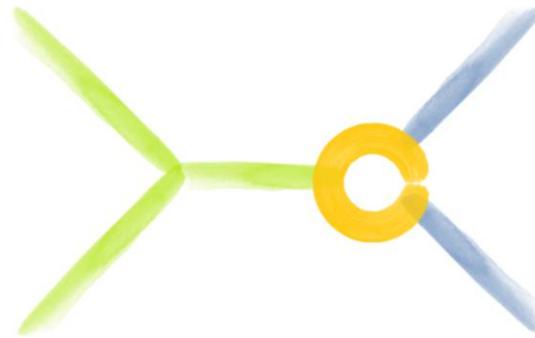

New Physics in higher-dimensional operators composed of SM fields:

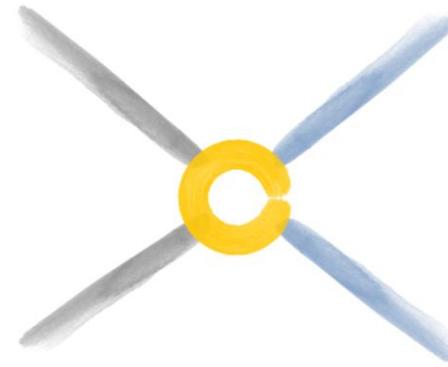

$$\mathcal{L}_{EFT} = \mathcal{L}_{SM} + \sum_i \frac{c_i}{\Lambda^2} \mathcal{O}_i^{(6)} + \sum_i \frac{b_i}{\Lambda^4} \mathcal{O}_i^{(8)} + \dots$$

The Plan

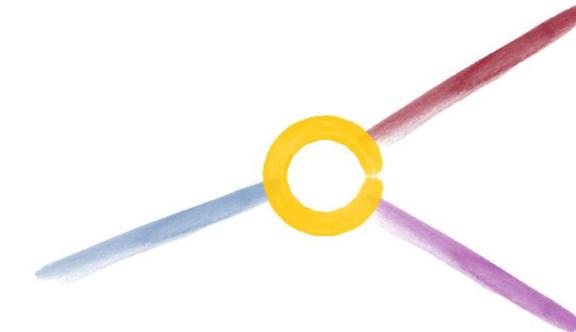

Consider all 6-dimensional EFT operators....

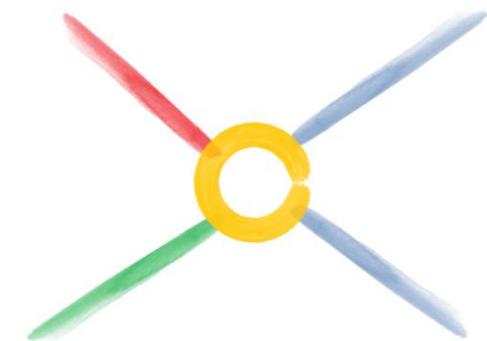

Top-gluon

4-quark

Quark-boson

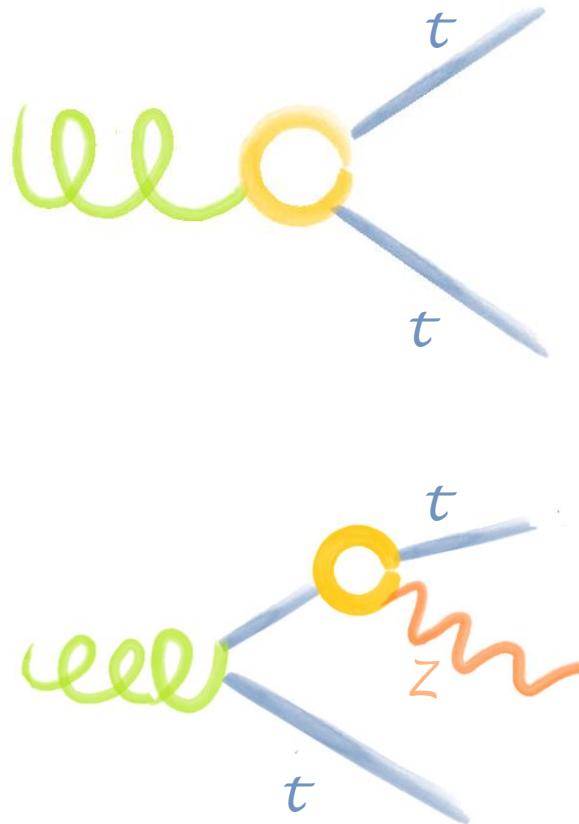

Relaxed flavour

$$\mathcal{L} \ni \frac{C_{Qq}}{\Lambda^2} (\bar{Q} \gamma_\mu Q) (\bar{q}_i \gamma^\mu q_i)$$

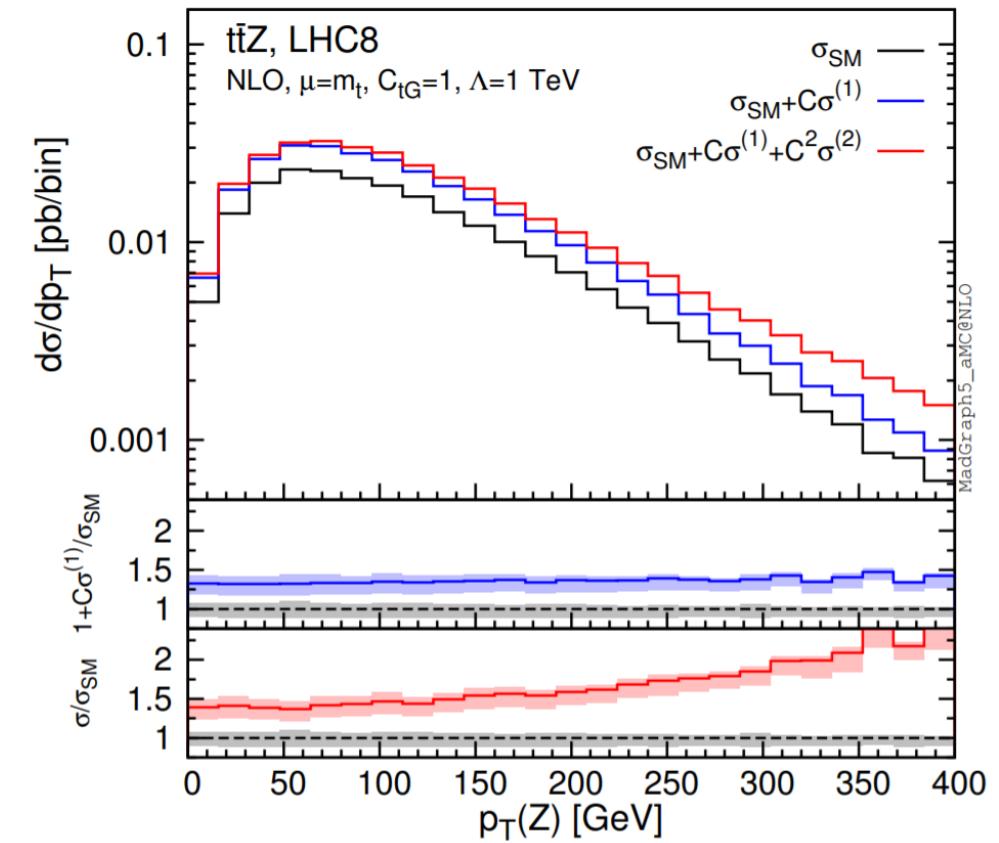

The Plan

How do these operators affect observables in

$p p \rightarrow t t$

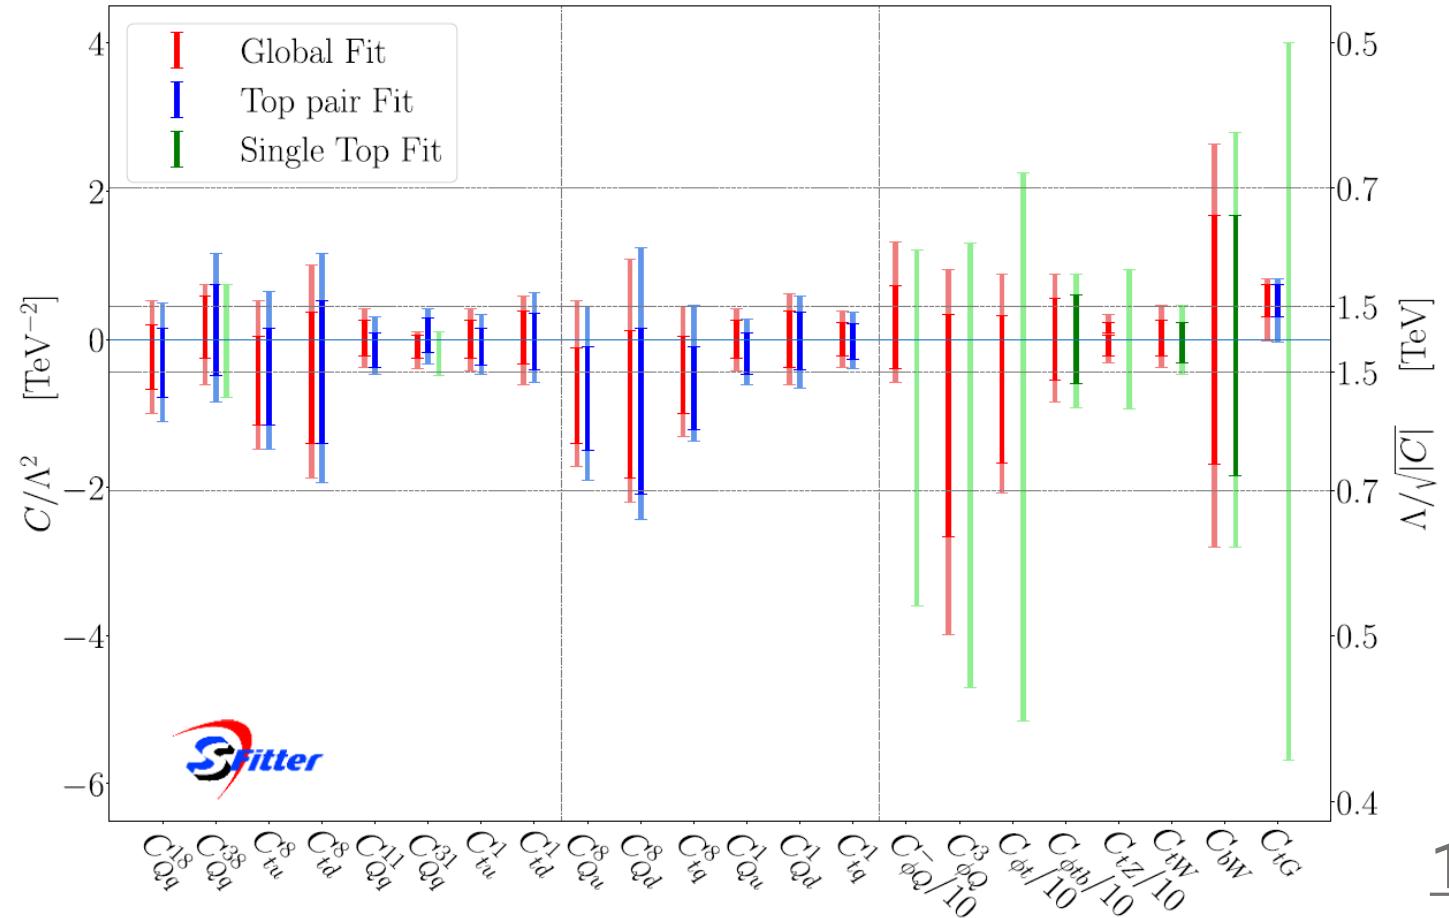

$p p \rightarrow t t Z$

The Plan

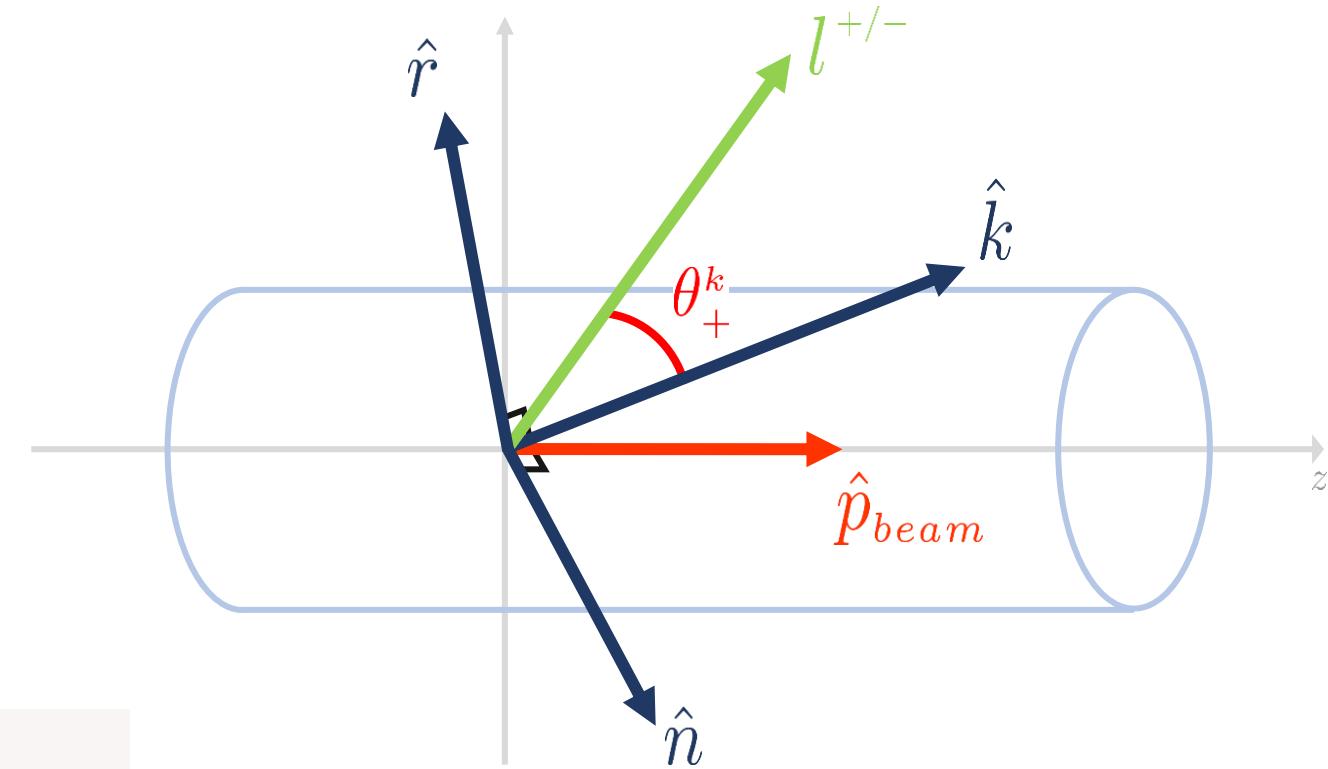

... to constrain Wilson coefficients!

Run II, ATLAS+CMS, 68% and 95% C.L.

Spin Observables

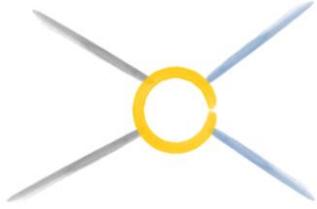

Can spin observables provide a “new spin” on top-quark EFT?

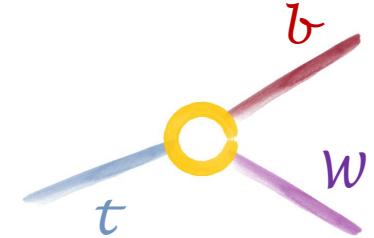

9 correlations $C = -9 \langle \cos \theta_+ \cos \theta_- \rangle$

6 polarisations $B_{+(-)} = 3 \langle \cos \theta_{+(-)} \rangle$

Why Spin Observables?

- EFT operators in production
- EFT operators in decay

- Calculated to NNLO QCD

Spin Observables

- Minimal set of measurements

- Different manifestation of BSM from “usual”

- CP-violating EFT operators
- EFT operators which affect chiral structures

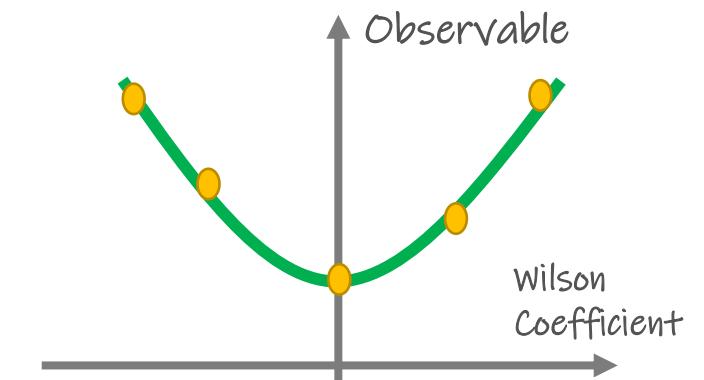

Practical EFT

Limits through fit

$$O \approx O_{SM} + \sum_i \alpha_i \frac{c_i}{\Lambda^2} + \sum_i \beta_i \frac{c_i^2}{\Lambda^4} + \sum_{i,j,i \neq j} \tilde{\beta}_{i,j} \frac{c_i c_j}{\Lambda^4}$$

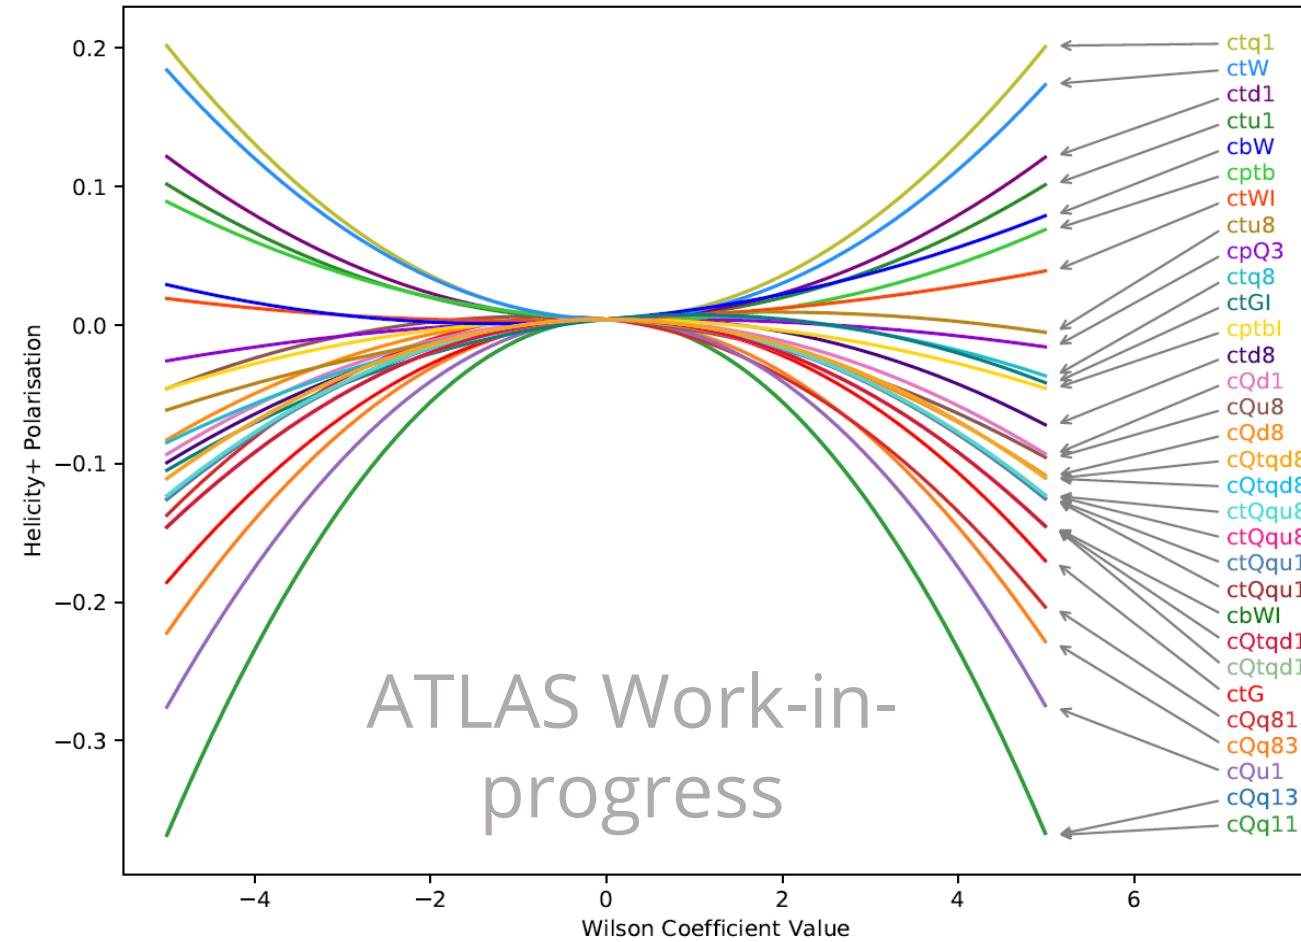

Measure

Parameterise
through modelling

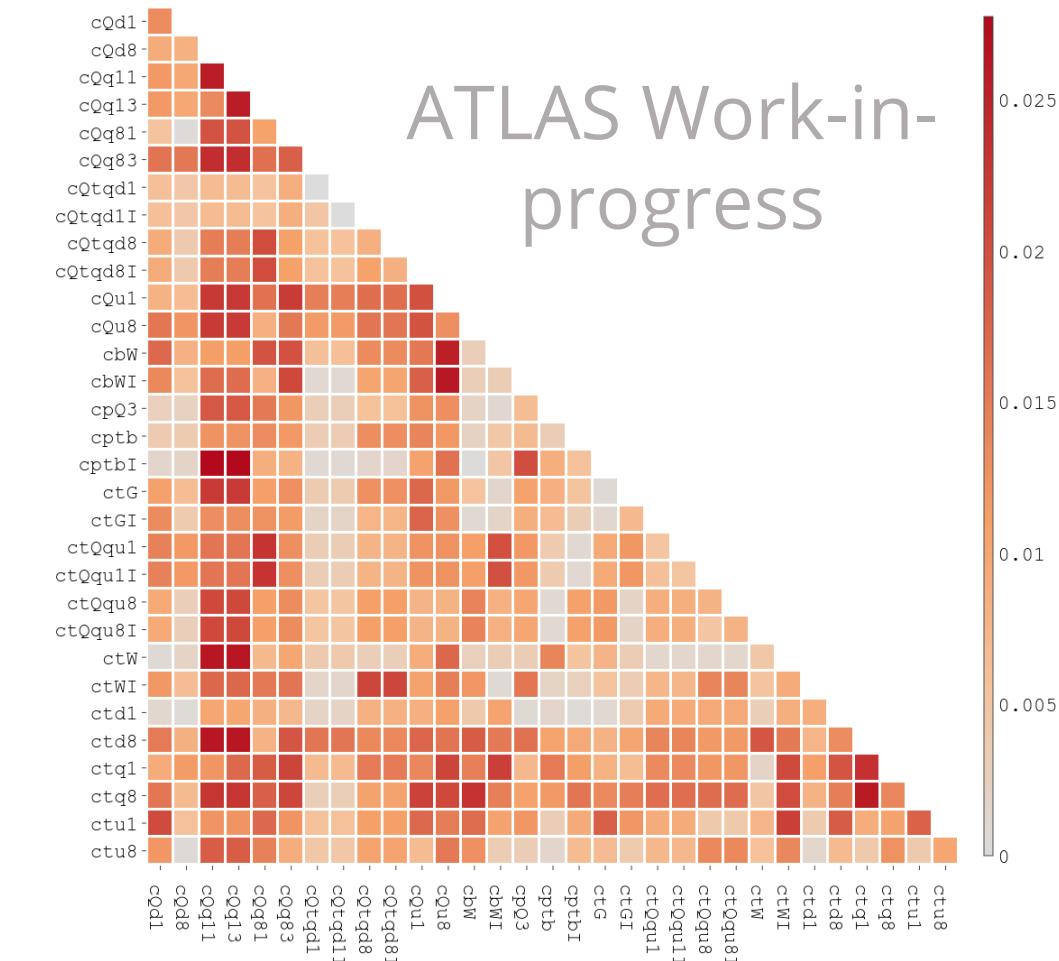

MC Parameterisation

Single operator

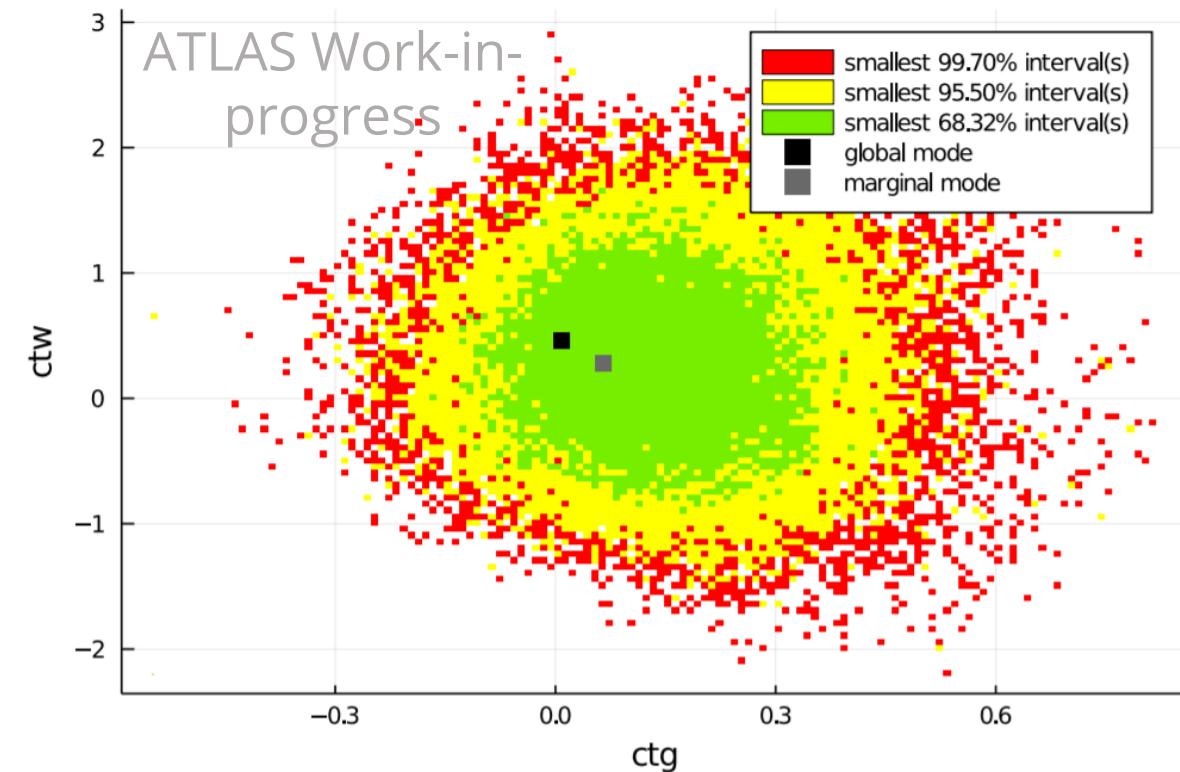

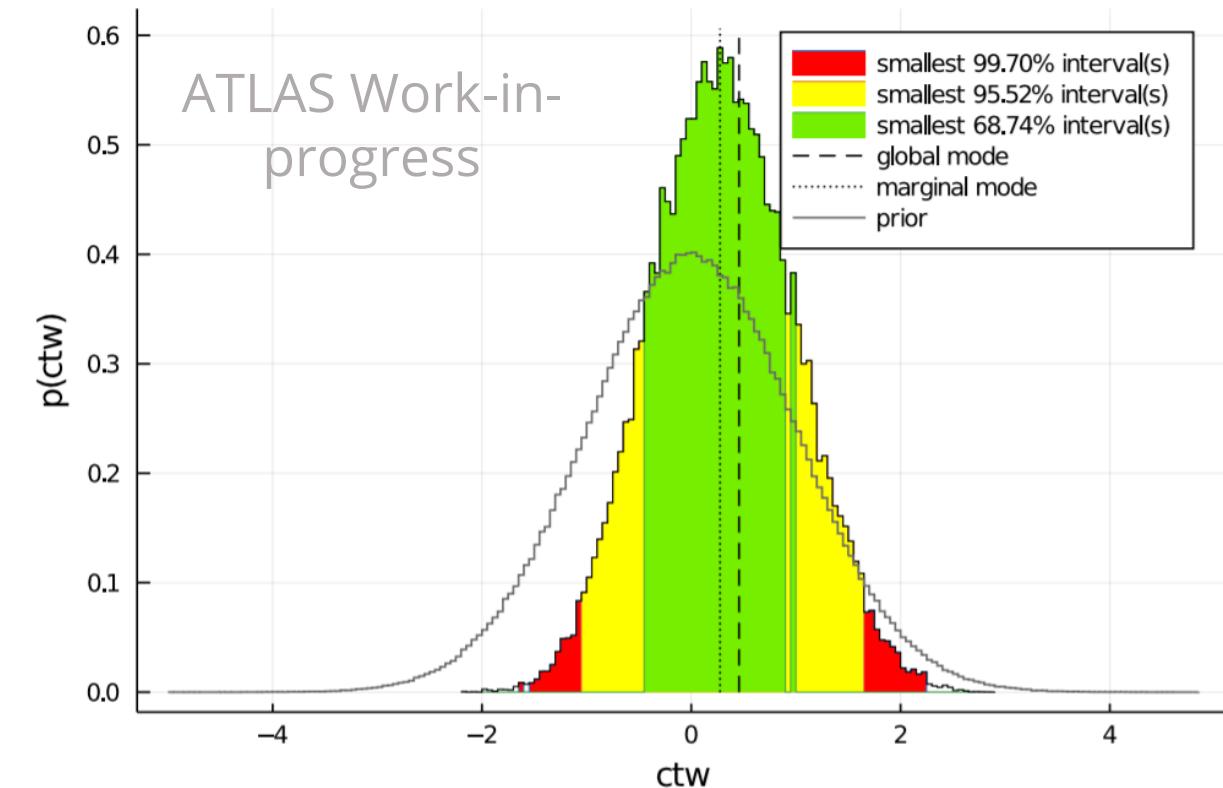

Two operators

Global Fit

Work in progress...
Plots by Baptiste Ravina
