

Theory and Simulation Challenges in DIS

Stefan Höche

Fermi National Accelerator Laboratory

Electrons for the LHC

CERN, 10/24/2019

Precision QCD calculations available to date

► Inclusive DIS at NLO QCD

[Bardeen,Buras,Duke,Muta] PRD18(1978)3998

[Altarelli,Ellis,Martinelli] NPB143(1978)521

[Humpert,van Neerven] NPB184(1981)225

[Currie,Gehrmann,Glover,Huss,Niehues,Vogt]

arXiv:1803.09973

► ... at N²LO QCD [Zijlstra,vanNeerven]

NPB383(1992)525, PLB297(1992)377

[Moch,Vermaseren] hep-ph/9912355

► ... at N³LO QCD [Moch,Vermaseren,Vogt]

hep-ph/0504242, arXiv:0812.4168

► Di-jet production at NLO QCD

[Mirkes,Zeppenfeld] hep-ph/9511448

[Graudenz] hep-ph/9710244

[Nagy,Trocsanyi] hep-ph/0104315

► ... at N²LO QCD

[Abelof,Boughezal,Liu,Petriello] arXiv:1607.04921

[Currie,Gehrmann,Niehues] arXiv:1606.03991

[Currie,Gehrmann,Huss,Niehues] arXiv:1703.05977

► DIS at N³LO QCD, fully exclusive

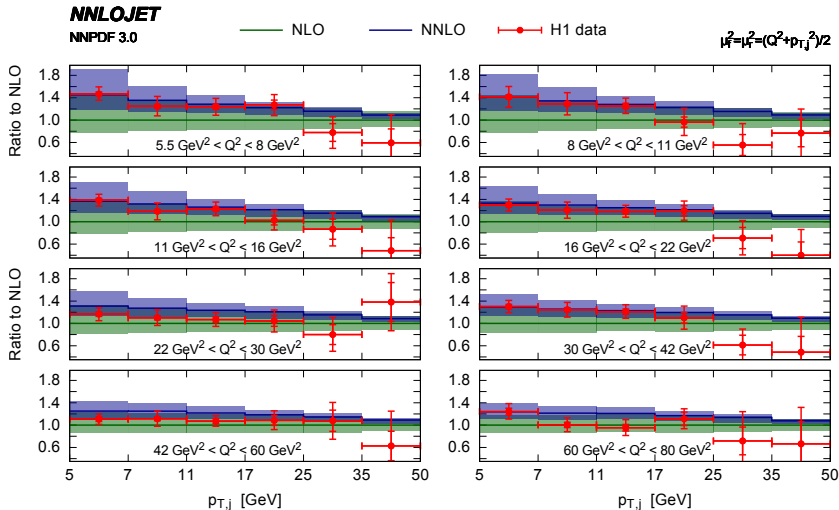

[Currie,Gehrmann,Glover,Huss,Niehues,Vogt]

arXiv:1803.09973

Highest precision for di-jet production

[Currie,Gehrmann,Huss,Niehues] arXiv:1703.05977

► H1 data from arXiv:1611.03421

Highest precision for inclusive DIS

[Currie, Gehrman, Glover, Huss, Niehues, Vogt] arXiv:1803.09973

- ▶ N³LO QCD, fully differential
- ▶ Projection-to-Born Antenna subtraction
- ▶ ZEUS data from hep-ex/0502029

$$Q^2 > 25 \text{ GeV}^2$$

$$y > 0.04$$

$$E_e' > 10 \text{ GeV}$$

$$E_{T,j} > 6 \text{ GeV}$$

$$-1 < \eta_j < 3$$

Precision QCD vs event generators

Anatomy of MC simulations

- ▶ **Hard interaction**
LO, NLO QCD/EW¹, NNLO QCD²
Generic matrix-element generators
- ▶ **Radiative corrections**
Parton Showers, YFS resummation
- ▶ **Hadronization & Decays**
Cluster / String model
Phase space or EFTs + YFS

Comparison to fixed order (FO)

- ▶ **Hard interaction**
Lower precision than FO
- ▶ **Radiative corrections**
Resummed & matched to FO
- ▶ **Hadronization & Decays**
Not accessible at FO

¹via interfaces to 1-loop generators

²for selected processes

Peculiarities of DIS

- ▶ Leading order $e^\pm p$ - scattering in collinear factorization

- ▶ No jets, sole kinematical variables are

$$Q^2 = q^2 = (k' - k)^2 \text{ and } x = \frac{Q^2}{2q \cdot p}$$

- ▶ Hadronic cm energy

$$W = Q\sqrt{(1-x)/x}$$

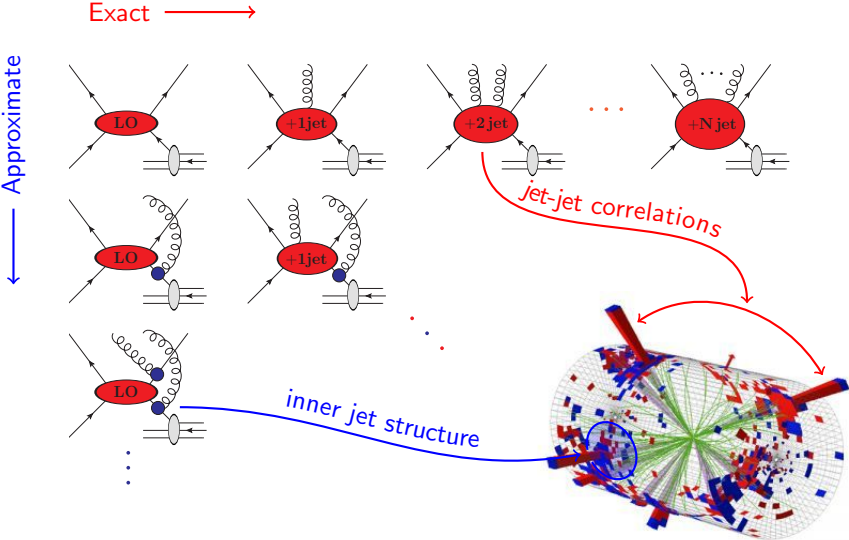

- ▶ QCD dynamics at higher orders

- ▶ Multiple scales, e.g. $E_{T,B}^2$
 - ▶ $e^\pm q \rightarrow e^\pm q$ if $E_{T,B}^2 \lesssim Q^2$
 - ▶ $\gamma^* g \rightarrow jets$ if $Q^2 \lesssim E_{T,B}^2$

- ▶ What makes DIS different from $e^+e^- \rightarrow jj$ and $pp \rightarrow e^+e^-$ is that the virtuality of the exchanged photon tends to be close to zero
- ▶ Also the case in low-mass Drell-Yan $pp \rightarrow e^+e^-$, but recent experimental studies usually focus on $m_{l\bar{l}} \approx m_Z$

Merging fixed-order calculations and parton-showers

Merging fixed-order calculations and parton-showers

- ▶ QCD dynamics of the multi-jet final state must be reflected accurately when identifying parton-shower branching history

[Carli,Gehrmann,SH] arXiv:0912.3715

- ▶ $e^\pm q \rightarrow e^\pm q$ if $E_{T,B}^2 \lesssim Q^2$
- ▶ $\gamma^* g \rightarrow \text{jets}$ if $Q^2 \lesssim E_{T,B}^2$
- ▶ $qg \rightarrow \text{jets}$ if $Q^2 \ll E_{T,B}^2$

- ▶ Similar to taking direct and fragmentation component into account in hard photon production at hadron colliders

[Schumann,Siegert,SH] arXiv:0912.3501

Comparison to HERA data

[Carli,Gehrmann,SH] arXiv:0912.3715

Variation of maximum matrix-element multiplicity, N_{\max}

Matching fixed-order NLO calculations to parton-showers

Matching fixed-order NLO calculations to parton-showers

Two possible ways to match NLO calculations and parton showers

MC@NLO

[Frixione,Webber] hep-ph/0204244

- ▶ Use parton-shower splitting kernel as infrared subtraction term
- ▶ Multiply LO event weight by Born-local K-factor including integrated subtraction term and virtual corrections
- ▶ Add hard remainder function consisting of subtracted real-emission correction

POWHEG

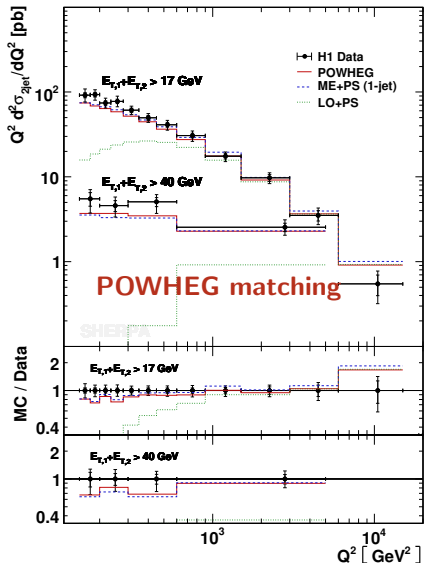

[Nason] hep-ph/0409146

- ▶ Use matrix-element corrections to replace parton-shower splitting kernel by full real-emission matrix element in first shower branching
- ▶ Multiply LO event weight by Born-local NLO K-factor (integrated over real corrections that can be mapped to Born according to parton-shower kinematics)

Both cases: Beware of sub-leading color terms and spin correlations!

Matching vs Merging

[Krauss, Schönherr, Siegert, SH] arXiv:1008.5399

[Carli, Gehrmann, SH] arXiv:0912.3715

Matching at NNLO accuracy

[Kuttimalai,Li,SH] arXiv:1809.04192

- ▶ New Sherpa module for computation of inclusive DIS at NNLO QCD
- ▶ Projection-to-Born method for fully differential fixed order predictions
[Zijlstra,vanNeerven] NPB383(1992)525, PLB297(1992)377 [Moch,Vermaseren,Vogt] hep-ph/0504242
[Bern,Dixon,Kosower] hep-ph/9708239, [Berger et al.] arXiv:0803.4180
- ▶ UN²LOPS matching to parton shower for particle-level simulations
[Lönnblad,Prestel] arXiv:1211.7278, [Li,Prestel,SH] arXiv:1405.3607
- ▶ Scale choice appropriate for simultaneous description of inclusive DIS and inclusive jet / di-jet / tri-jet production $\rightarrow \mu_{R/F}^2 = (Q^2 + (H_T/2)^2)/2$

- ▶ Good agreement with H1 measurements in both high- Q^2 and low- Q^2 region [Andreev et al.] arXiv:1406.4709, arXiv:1611.03421

NNLO particle-level simulation vs. H1 high- Q^2 data

[Kuttimalai,Li,SH] arXiv:1809.04192

NNLO particle-level simulation vs. H1 low- Q^2 data

[Kuttimalai,Li,SH] arXiv:1809.04192

Availability of DIS simulations

▶ Herwig

- ▶ Matching fully automated [Gieseke,Plätzer] arXiv:1109.6256
- ▶ External 1-loop providers & builtin loop library
- ▶ Merging in modified unitarized approach [Plätzer] arXiv:1211.5467, [Bellm,Gieseke,Plätzer] arXiv:1705.06700
- ▶ QED & mixed higher-order corrections work in progress

▶ Pythia

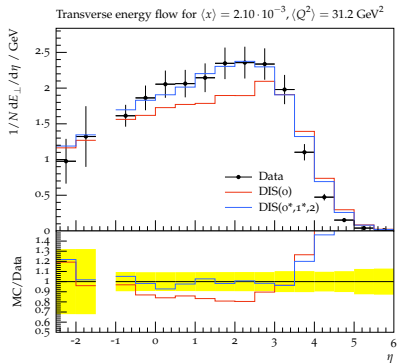

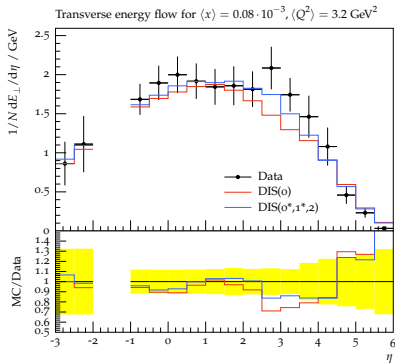

- ▶ New parton shower Dire [Prestel,SH] arXiv:1506.05057
- ▶ Unitarized merging under development [Prestel,Lönnblad] arXiv:1211.4827
- ▶ Matching via interface to POWHEG / MC@NLO

▶ Sherpa

- ▶ Matching fully automated [Krauss,Schönherr,Siegert,SH] arXiv:1008.5399, arXiv:1111.1220
- ▶ External 1-loop providers & builtin loop library
- ▶ Merging in non-unitarized approach [Krauss,Schönherr,Siegert,SH] arXiv:1207.5030
- ▶ NNLO matching [Kuttimalai,Li,SH] arXiv:1809.04192

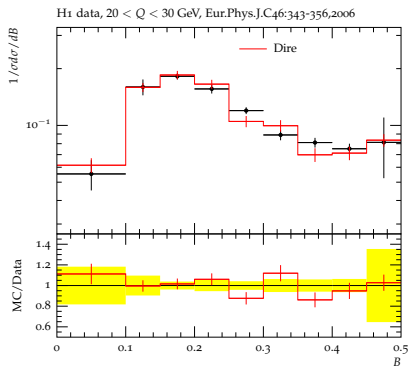

Performance examples – Herwig

► NLO Merged calculation vs data from hep-ex/9907027

Performance examples – Pythia

- Parton-shower calculation vs data from hep-ex/0512014

Performance examples – Sherpa

[Carli,Gehrmann,SH] arXiv:0912.3715

three-jet center-of-mass frame:

$1 + 2 \rightarrow 3 + 4 + 5$

$E_3 > E_4 > E_5$

$\cos \theta_3 \quad Q^2 > 150 \text{ GeV}^2$

$\Psi_3 \quad Q^2 > 150 \text{ GeV}^2$

Summary

Fixed-order QCD

- ▶ QCD calculations available up to N³LO for inclusive DIS
- ▶ Peculiarities of DIS require careful selection of scales
- ▶ Excellent description of experimental data from HERA

MC event simulation

- ▶ DIS simulations available in all three event generation frameworks
- ▶ NLO matching & merging standard, NNLO matching available
- ▶ Peculiarities of DIS require careful selection of clustering history
- ▶ Very good description of wide range of experimental data
