## Motivation

### Intense magnetic fields

- Heavy ion experiments

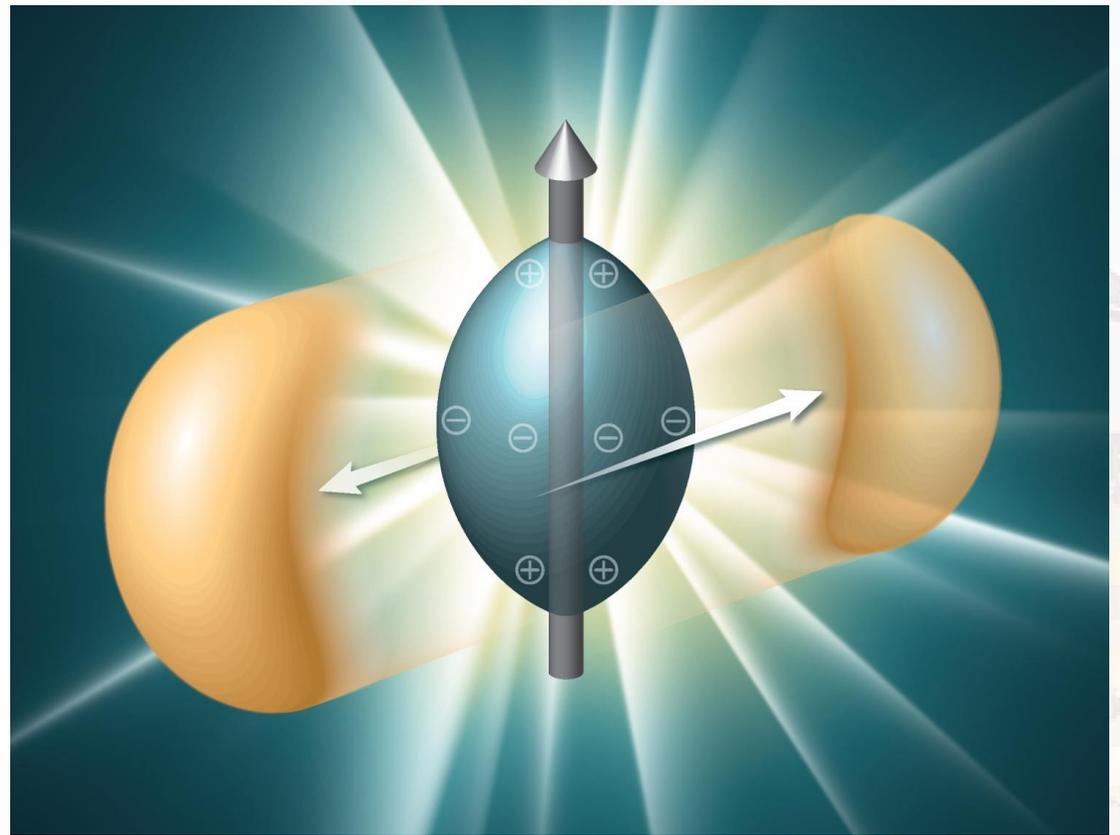

$$B \sim 10^{19} - 10^{20} \text{ Gauss}$$

$$0.1 - 1 \text{ GeV}^2$$

- Magnetars

$$B \sim 10^{18} - 10^{19} \text{ Gauss}$$

$$0.01 - 0.1 \text{ GeV}^2$$

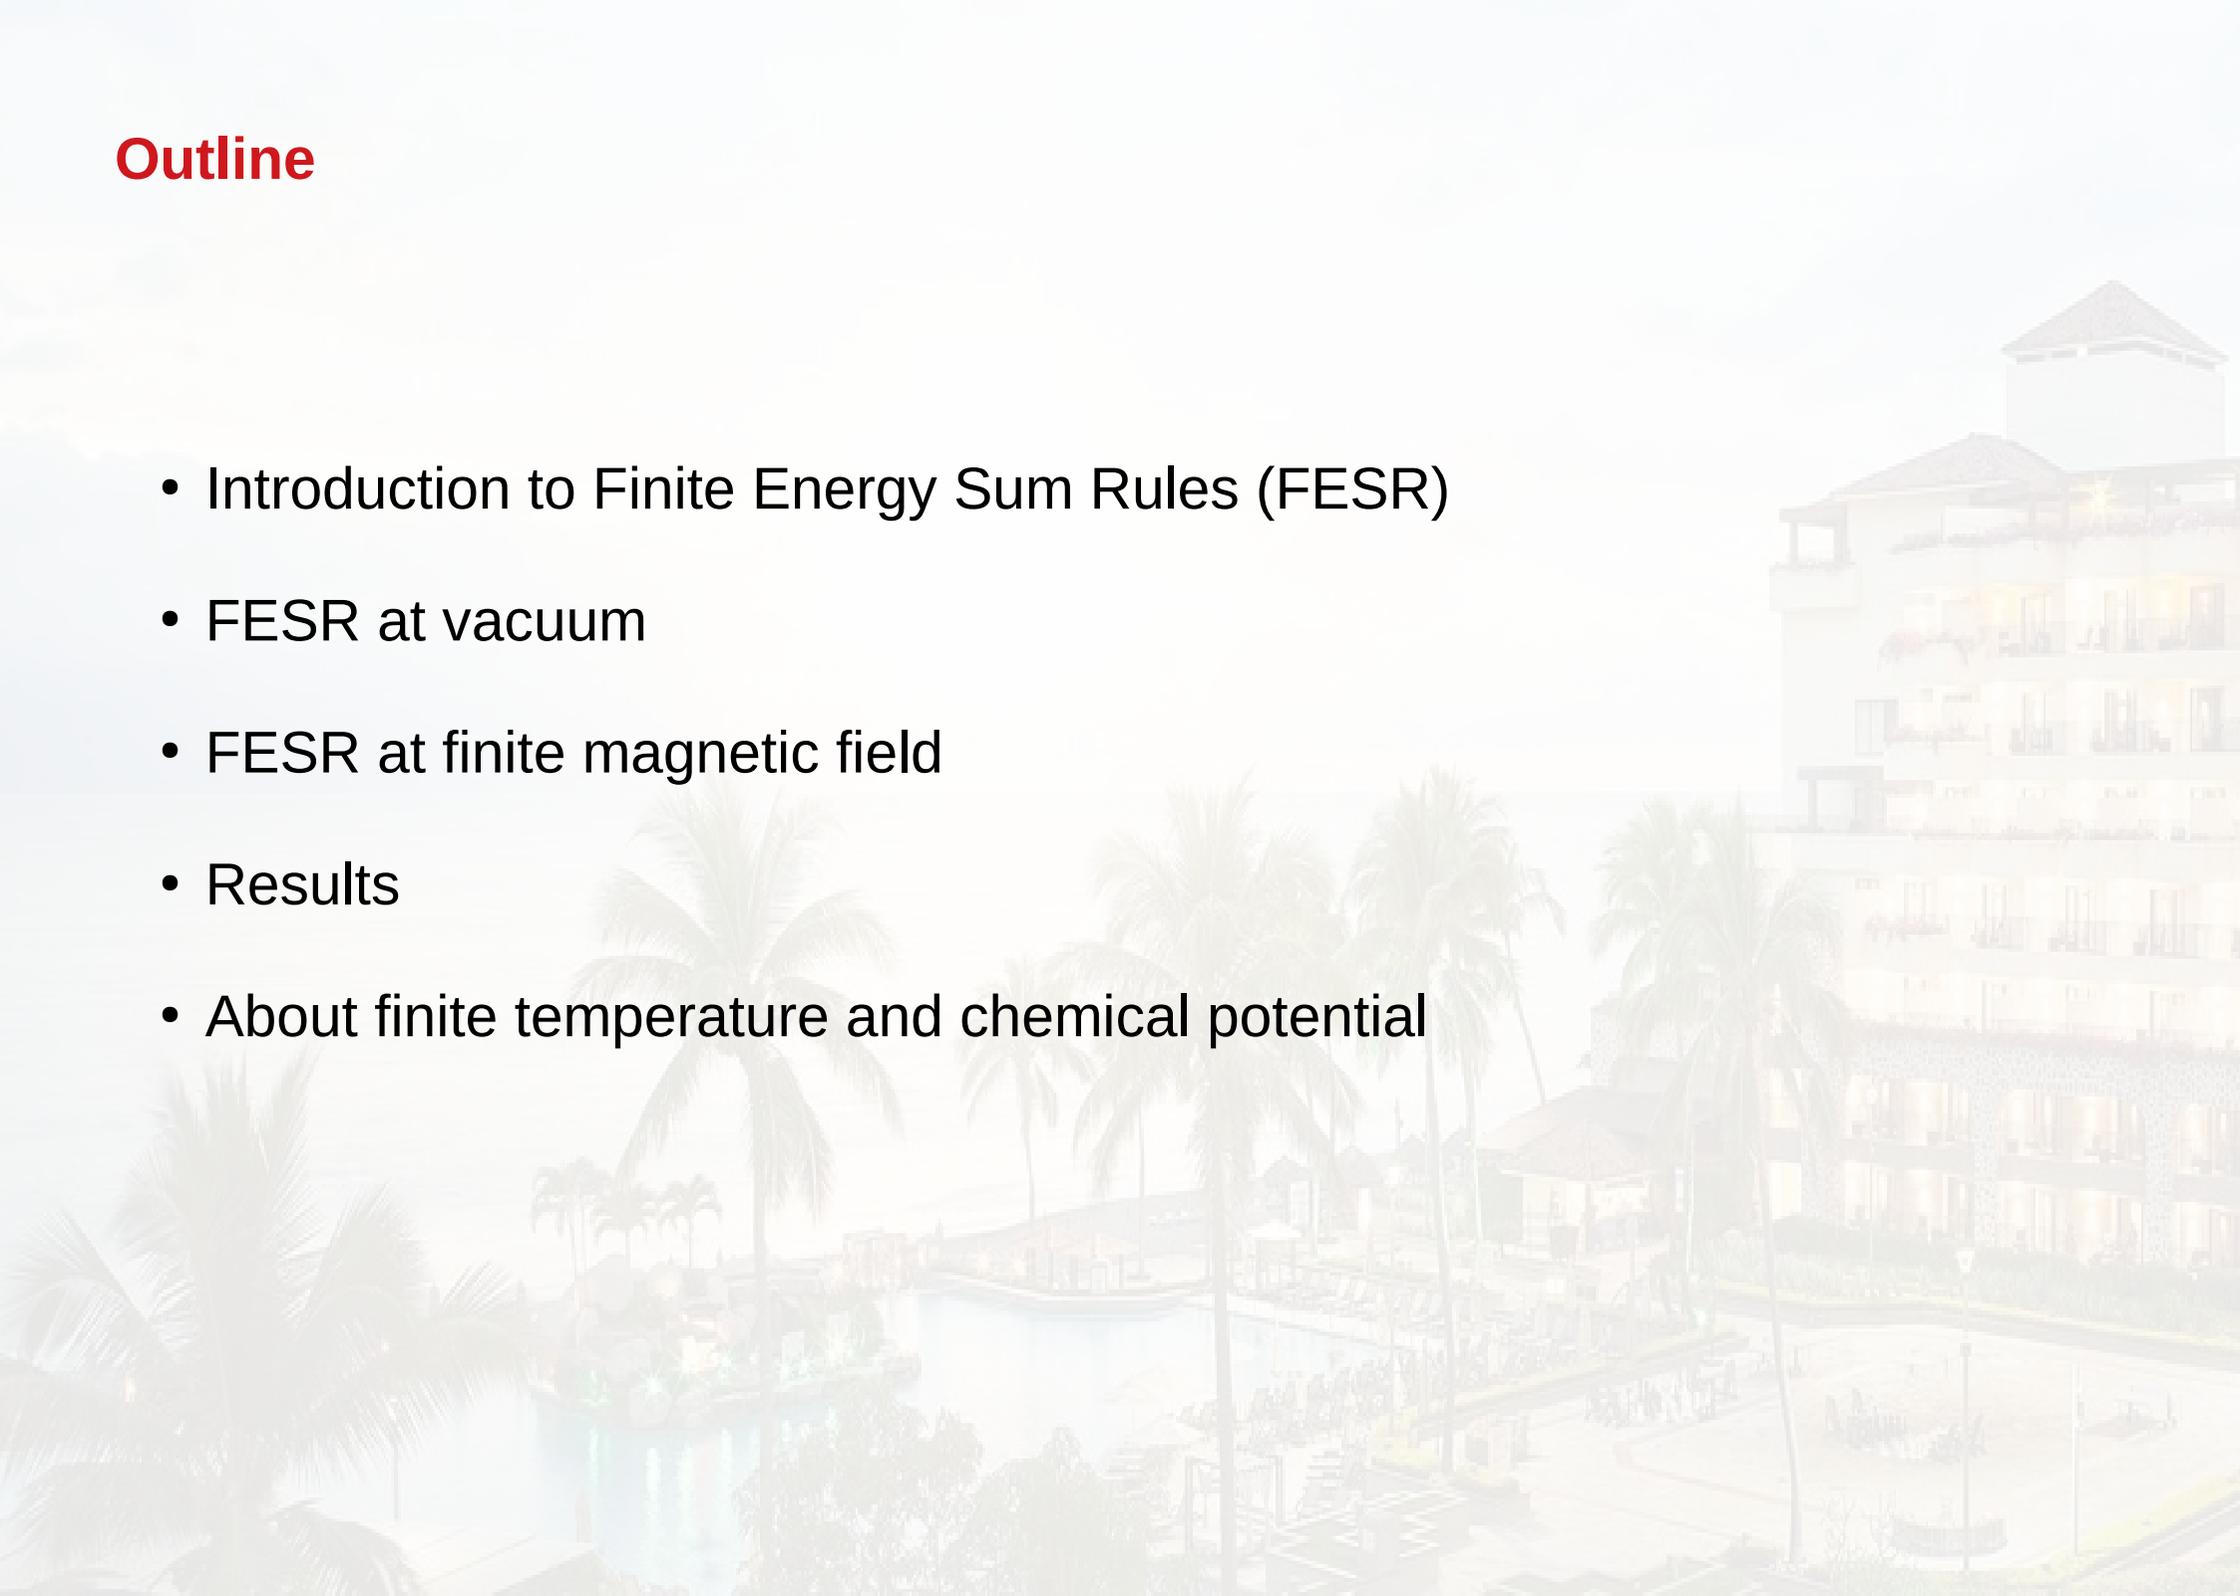

## Commonly used Models for QCD and Hadronic physics

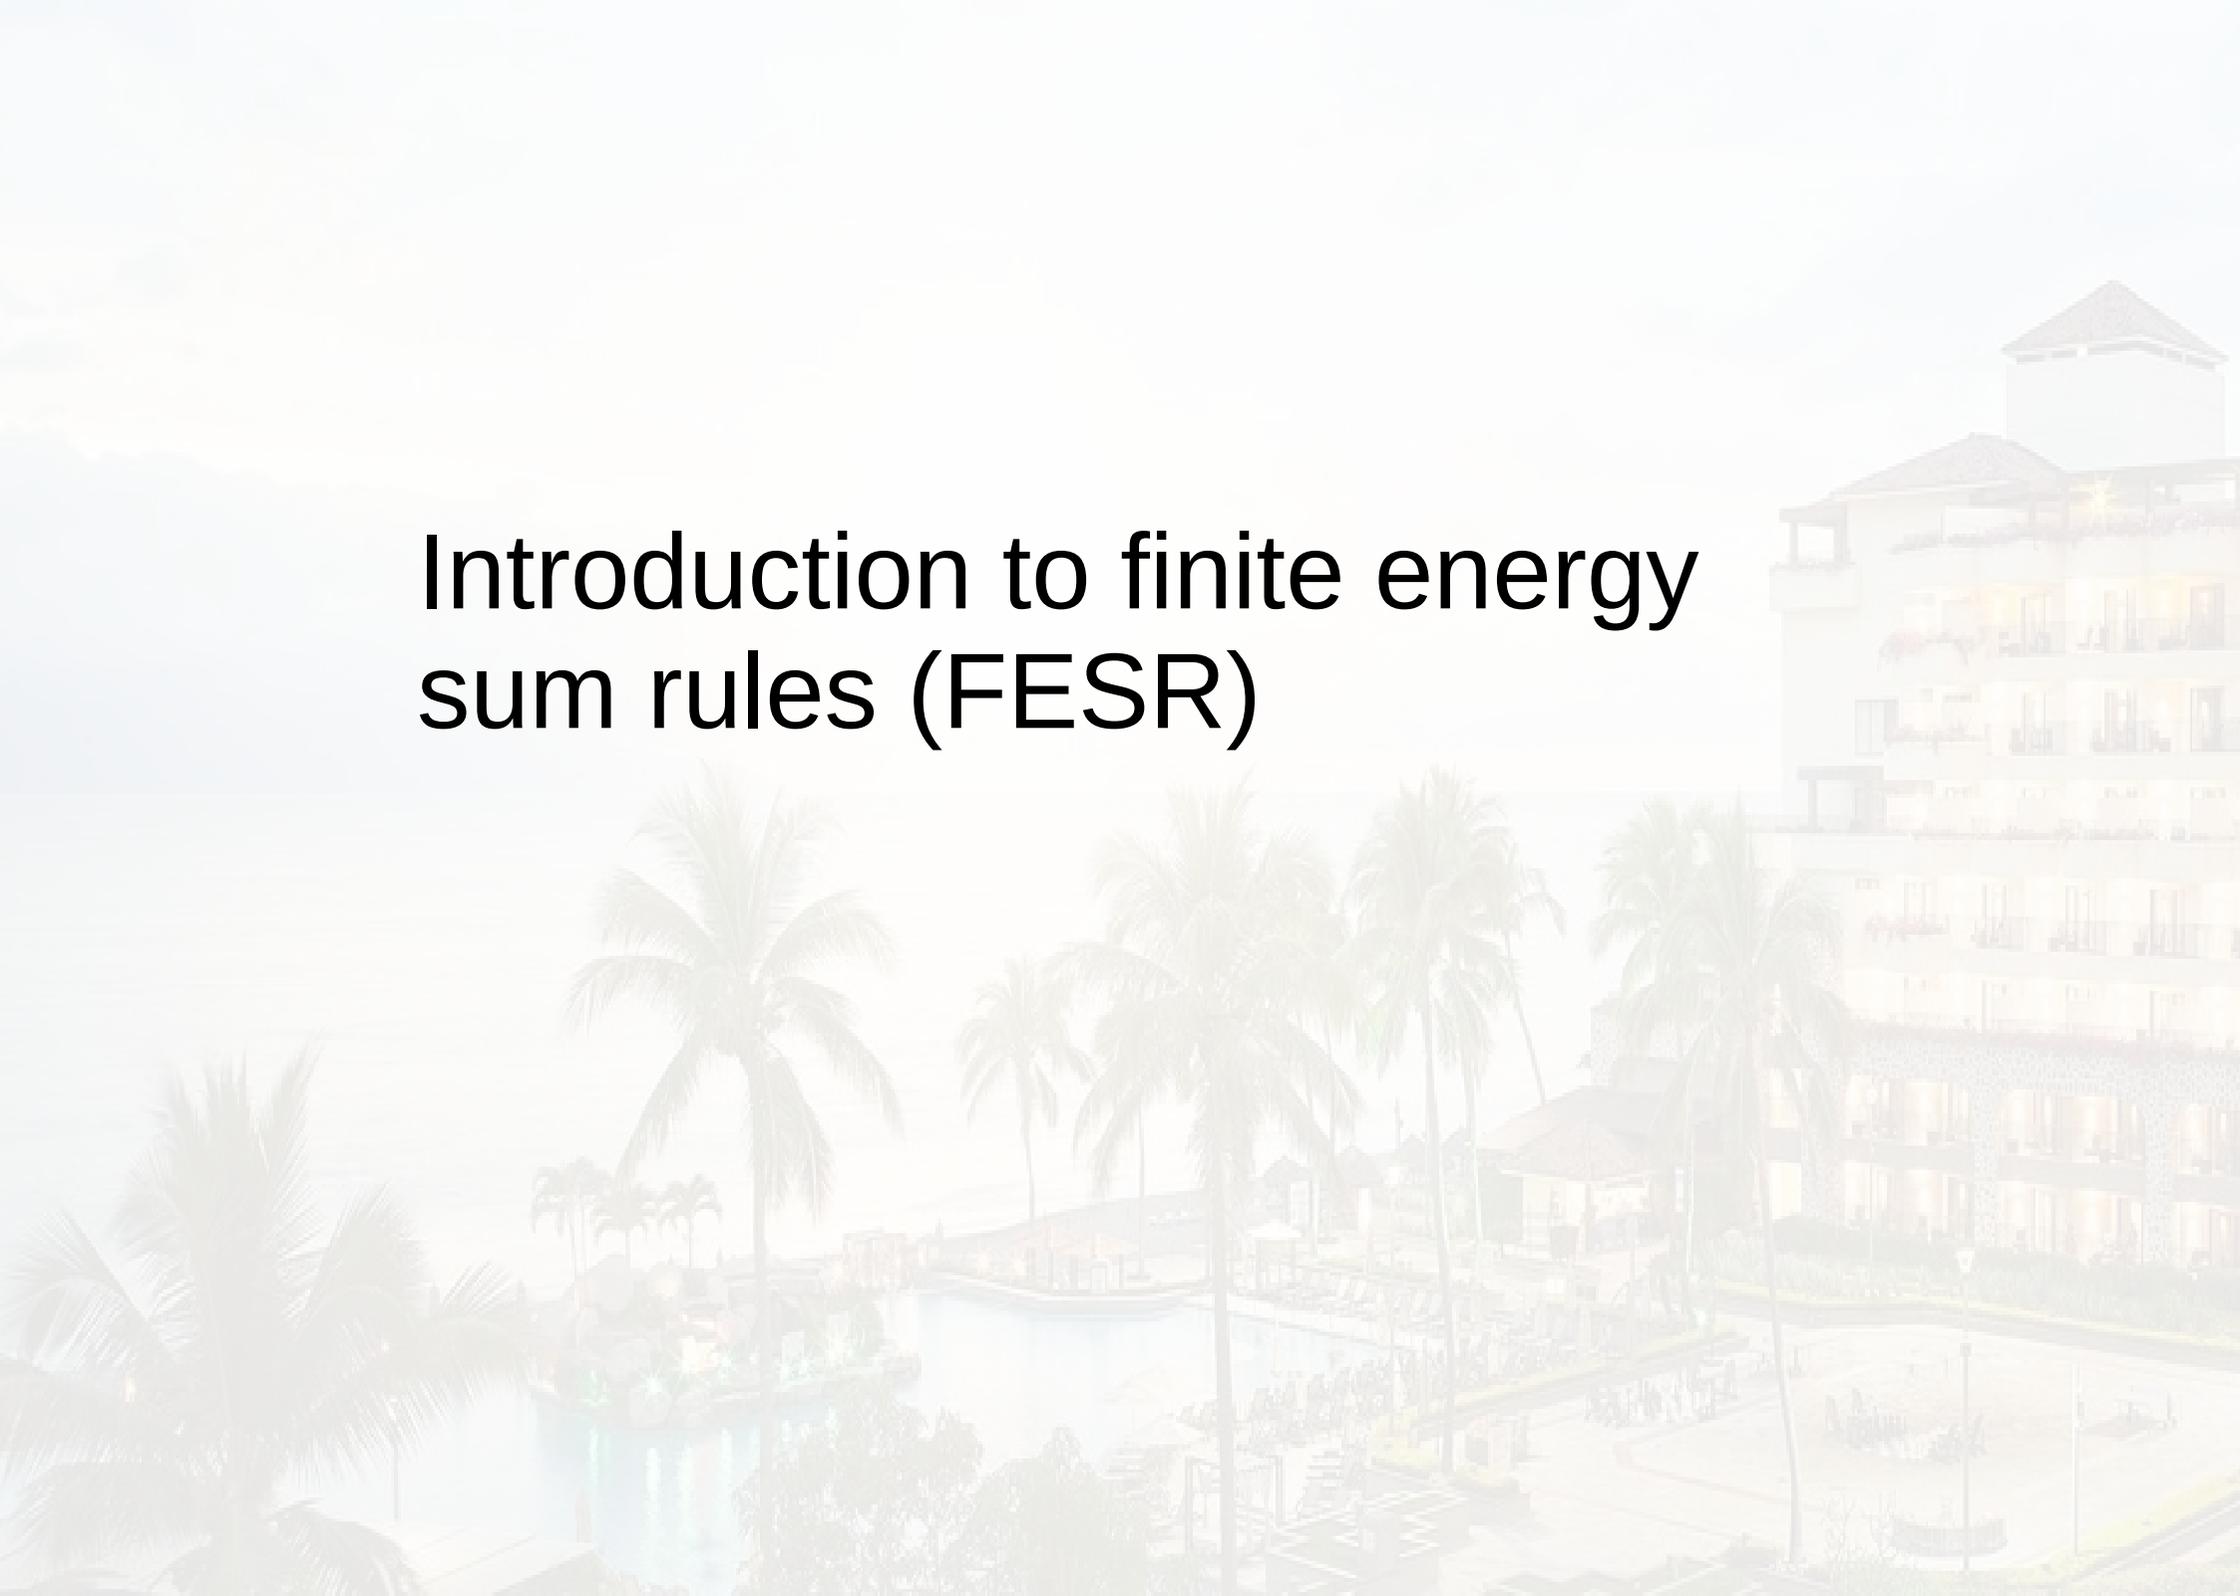

- Perturbative QCD → do not include non-perturbative effects
- Lattice QCD → sign problem
- Schwinger Dyson equation → extremely complicated
- Nambu Jona Lasinio → cutoff dependent
- Sigma models → good for low temperature and chemical potential
- Functional renormalization group → recently studied at finite B
- **QCD sum rules** → studied and forgotten at finite B since late 90's  
(Borel sum rules)

## Operator product expansion (OPE)

$$\Pi^{\text{QCD}}(s) = \sum_{n=0}^{\infty} C_{2n}(s, \mu) \frac{\langle O_{2n}(\mu) \rangle}{s^n}$$

$C_{2n}$       Wilson parameters (dimensionless)

$\langle O_{2n} \rangle$       Condensates (dimension  $2n$ )

$$\langle O_0 \rangle = 1$$

$$\langle O_2 \rangle = 0$$

$$\langle O_4 \rangle \sim \alpha_s \langle G_{\mu\nu}^a G^{a\mu\nu} \rangle, \quad m_q \langle \bar{q}q \rangle$$

$$\langle O_6 \rangle = \dots$$

# About Finite temperature and chemical potential

## Chemical potential

- FESR's cut the series
- New condensates easily isolated
- Dominant scale  $s_0$

## Finite temperature

- FESR's do not cut the series
- More inputs to test approximations

## Conclusions

- Magnetic evolution of QCD and Hadronic parameters
- Quark mass must change with magnetic field
- All the parameters grow (except gluon condensate)
- Valid for large values of  $B$
- Relation  $m_q/m_\pi^2 = \text{const.}$  seems to be valid at finite  $B$
- Pion decay constant our most robust prediction
- Gluon condensate needs a deep treatment

# Outlook

- Finite temperature (soon)
- Finite baryon density (soon)
- $\langle \bar{q}\sigma_{12}q \rangle$
- Baryon parameters ( $g_A$  soon)
- New condensates
- Different quark masses (vector channel)
