

C7, pilot2 and singularity deployment

A. Forti, P. Svirin

ADC weekly

24 September 2019

CentOS7

- Only 11 sites still to migrate
 - All switched to test or brokeroff.
 - There are no more queues running pilot1 online

Urgent!!!!

Singularity Not installed

- Queues not running singularity yet: 39
 - **online+test+brokeroff**
 - HPC
 - Still on SL6
 - Some shared facility waiting for upgrade of custom software
 - Test queues
- Expected to reduce further by end of the year

Singularity with some config problems

- 16 sites fail the HC tests for standalone containers.
 - Firewall restrictions
 - Image origin restriction
 - Only the runtime installed
 - Some time outs
- Standalone containers
HC tests
- JIRA Ticket:
ADCINFR-142

Singularity in CVMFS

- singularity deployment from CVMFS doesn't require sites to install the rpm
 - Only Requires sites to enable user NS because the executable in /cvmfs will not use setuid for this to work.
- Agreed also at the WLCG container meeting.
 - Experiments agreed **not** to have a common executable to avoid to break each other workflows.
- Would free ATLAS to run the workloads it needs without interfering with local users or other experiments setup and restrictions.
 - **Reminder: user namespaces = unprivileged**

Singularity in CVMFS

- Current version problem
 - Still needs libseccomp and squashfs-tools but testing version works without

```
echo "user.max_user_namespaces = 15000" > /etc/sysctl.d/90-max_user_namespaces.conf
sysctl -p /etc/sysctl.d/90-max_user_namespaces.conf
```

- Testing version only needs user namespaces
- If sites enable user namespaces it's a **no brainer** using singularity from CVMFS eventually
 - Hope is to require only CVMFS on the WNs
 - Everything else in CVMFS itself or in containers
