

## Impact of (axial)vector coefficients on $B \rightarrow K_1 \ell \ell$ decay modes

Friday 1 October 2021 10:50 (2 hours)

We analyse the rare semileptonic decays of  $B$  meson to axial vector mesons  $K_1(1270)$  and  $K_1(1400)$  mediated by the flavor changing neutral current  $b \rightarrow sll$  quark level transition, in an effective field theory approach. We perform a global fit to all the relevant and up-to-date  $b \rightarrow sl^+l^-$  data for various sets of (axial)vector couplings. We then look over the implications of the allowed parameter space on the branching ratios and several physical observables such as forward-backward asymmetry, lepton polarization asymmetry and lepton flavor universality violating parameters of  $B \rightarrow K_1 l^+ l^-$  processes.

### What is your topic?

Rare decays
