

Nucleon Structure at Low Q

AVRA IMPERIAL HOTEL, CRETE, GREECE, 15 MAY – 21 MAY 2023

TPE contribution to the µH Lamb shift & proton polarizability from lattice QCD

Xu Feng

2023.05.17

Based on Y. Fu, XF, L. Jin, C. Lu, PRL 128 (2022) 17, 172002 + new progress

Spectroscopy and quantum field theory

Important observable – Lamb shift Dirac Lamb 2P3/2 Energy levels 20% 20% 1947, Lamb discovered the nondegeneracy 25 1/2 25% Lamb shift 1955

Dirac theory predicts that $2P_{1/2}$ and $2S_{1/2}$ states are degenerate

> QED - Lamb shift mainly originates from quantum fluctuation of EM fields (VP + electron self energy)

| Theory: | 1057832.3(3) kHz | [PRA 93 (2016) 022513] |
|-------------|--------------------|---------------------------|
| Experiment: | 1057829.8(3.2) kHz | [Science 365 (2019) 6457] |

- Consistency between theory and experiment •
 - Lay the foundation of QED
- High-precision measurement of spectroscopy

Provide information of proton's structure

Tomonaga

Schwinger

Feynman

Muonic hydrogen

- Muon mass is about 200 times of electron
- Bohr radius for μH is 200 times smaller than H

- ➢ 2010, proton charge radius from µH
 【Nature 466 (2010) 213】
 - Precision 10 times better than before
 - 4% smaller radius

 5σ deviation \rightarrow Proton size puzzle

New experimental progress

- ➤ Still some discrepancies
- Consistently shrink the proton size

Puzzle possibly originates from experiments

However, as a fundamental quantity, the size of proton charge radius plays an important role in the theoretical prediction in spectroscopy

Direct lattice QCD calculation of charge radius

Charge radius is the derivative of form factor

still hard to achieve ~1% accuracy

Direct lattice QCD calculation of charge radius

Various systematic effects, especially the model dependence

$$\langle H(p_f)|J_{\mu}|H(p_i)\rangle = \bar{u}(p_f)\left[\gamma_{\mu}F_1(q^2) + \frac{i\sigma^{\mu\nu}q_{\nu}}{2M}F_2(q^2)\right]u(p_i), \quad q^2 = (p_f - p_i)^2$$

• Momenta p_i and p_f on the lattice are always discrete: $\frac{2\pi}{L}n \implies$ modeling of q²-dependence to extract charge radius

| | | | Isovector | |
|----------------------|-------------------------------------|--------------------------------|-------------------------------------|------------------|
| Fit type | $q_{\rm cut}^2$ [GeV ²] | $t_{\rm sep}/a$ | $\sqrt{\langle r_E^2 \rangle}$ [fm] | χ^2/dof |
| Linear | 0.013 | $\{12, 14, 16\} \\ \{14, 16\}$ | 0.764(26) 0.806(35) | |
| Dipole | 0.102 | $\{12, 14, 16\} \\ \{14, 16\}$ | 0.785(17) 0.806(26) | 1.2(8) 0.6(6) |
| Quadrature | 0.102 | $\{12, 14, 16\} \\ \{14, 16\}$ | 0.785(19) 0.783(30) | 1.0(8) 0.7(7) |
| $z-\exp(k_{\max}=3)$ | 0.102 | $\{12, 14, 16\} \\ \{14, 16\}$ | 0.776(28) 0.796(37) | 1.2(9) 0.8(8) |

[PACS Collaboration used a (10.8 fm)⁴ lattice, PRD 2020]

- Model dependence could cause a 3% shift in r_p , e.g. $0.806(26) \rightarrow 0.783(30)$
- Twisted boundary condition can help, but requires more computational resources and still a fit functional form
- Why not calculate the charge radius directly at $q^2=0 \implies$ A model-independent approach to extract charge radius

XF, Y. Fu, L. Jin, PRD 101 (2020) 051502

Various contributions to µH Lamb shift

Challenges from TPE (1): IR divergence

- \succ Binding energy of μ H serves as a natural IR cutoff
 - Bound-state QED

Proton treated as point-like particle + charge radius correction

No divergence, but rich structure information lost

QCD+QED: complete information of proton structure

Loop integral sensitive to hadronic scale \rightarrow highly NP

Bound lepton \rightarrow free lepton \rightarrow IR divergence

Solution: subtract the divergence

Challenges from TPE (1): IR divergence

Leptonic part: $L_{\mu\nu}(q) \rightarrow$ Analytically known

Hadronic part: $H_{\mu\nu}(q) \rightarrow$ Provided by LQCD (statistical errors)

Loop integral $\Delta E^{\text{IR-}\infty} = \int \frac{d^4q}{(2\pi)^4} L_{\mu\nu}(q) H_{\mu\nu}(q)$ $= \int d^4x L_{\mu\nu}(x) H_{\mu\nu}(x)$

IR subtraction

Key technical problem

Three diagrams contain diff. stat. errors

How to maintain the error cancellation?

If signal cancels and error does not, then signal is completely hidden by error

Challenges from TPE (1): IR divergence

To solve IR divergence: infinite-volume reconstruction method [X. Feng, L. Jin, PRD 100 (2019) 094509]

Basic idea: low-energy structure information is contained in the long-distance part of hadronic function

Use $H_{\mu\nu}(x)$ to reconstruct the quantities such as charge radius

Challenges from TPE (2): Signal-to-noise problem

 $H_{\mu
u}(x)$

Property of lattice data:

As x increases, proton matrix element $H_{\mu\nu}(x)$ decreases as $e^{-M_p|x|}$

However, error decreases as $e^{-\frac{3}{2}M_{\pi}|x|}$

Challenges from TPE (2): Signal-to-noise problem

To solve S/N problem: optimized subtraction scheme [Y. Fu, X. Feng, L. Jin, C. Lu, PRL 128 (2022) 172002]

Trick: A = (A - B) + B

Define the reduced weight function

 $L^{(r)}(x) = L^{\text{sub}}(x) - c_0 L^{\text{pt-like}}(x) - c_r L^{\text{radius}}(x)$

- Choose c_0, c_r to minimize $L^{(r)}(x)$ in the region of 1-3 fm
- Using $L^{(r)}(x)$, (A-B) part is illustrated by the red curve

• Total contribution is $\Delta E = \Delta E^{(r)} + c_0 + c_r \cdot \langle r_p^2 \rangle$

Use optimized subtraction scheme in realistic calculation

11

Challenges from TPE (3): Computation of 4-point function

• TPE - hadronic part from a typical 4-point function

• Perform the volume summation for each point

• From 3-point to 4-point function

Solution: Field sparsening method

- Less summation points may lead to lower precision
- It is not the case because of high correlation in lattice data
 - 10²-10³ times less points yields similar precision
- Used for diff. physical system to confirm the universality

Utilize field sparsening method

• Reduce the computational cost by a factor of 10²-10³ with almost no loss of precision!

Challenges from TPE (3): Computation of 4-point function

Complicated quark field contraction for nucleon 4-point function – 10 types of connected diagrams

> There are also disconnected diagrams – notorious for high cost and bad S/N ratio

 \succ

Our calculation contains both connected and the main disconnected diagrams

Challenges from TPE (3): Computation of 4-point function

Two currents inserted in one quark line

Two currents inserted in two quark lines

Using the conditions such as charge conservation to verify the contraction code

Lattice results

Gauge ensemble used – nearly physical pion mass

| Ensemble | $m_{\pi} [{ m MeV}]$ | L/a | T/a | $a \; [{ m fm}]$ | $N_{\rm conf}$ |
|----------|-----------------------|-----|-----|------------------|----------------|
| 24D | 142 | 24 | 64 | 0.1943(8) | 131 |

- $\Delta E_{\text{lat}} = \begin{cases} 27.6(4.5) \ \mu \text{eV}, & \text{connected part}, \\ 2.1(2.1) \ \mu \text{eV}, & \text{disconnected part}, \\ 29.7(4.9) \ \mu \text{eV}, & \text{total contribution}. \end{cases}$
- \succ The total TPE contribution is given by

 $\Delta E_{\rm TPE} = 0.77 + 93.72 \cdot \langle r_p^2 \rangle - \Delta E_{\rm lat}$

- Matching ΔE_{TPE} with Exp. measurement, one gets $\sqrt{\langle r_p^2 \rangle} = 0.84136(65) \text{ fm}$ consistent with 0.84087(39) fm quoted by μ H Exp
- Using μ H value of charge radius as input, one gets $\Delta E_{\text{TPE}} = 37.4(4.9) \ \mu \text{eV}$

Lattice results

Compared with other theoretical work

Yang Fu (PhD, 5th year) \rightarrow MIT postdoctor

• First lattice result @ m_{π} =142 MeV

 $\Delta E_{\rm TPE} = 37.4(4.9) \quad \mu eV$

• Need to increase statistics and control systematic effects

Outlook: to help answer the question – what is the exact size of proton

Evaluate the subtraction function

- Dispersion relation relate the scattering data to the TPE amplitude
- ➢ UV divergence requires the once-subtracted dispersion relation → Subtraction function depends on model assumption
- F. Hagelstein & V. Pascalutsa propose a different subtraction point for lattice QCD calculation [NPA 1016 (2021) 122323]

Subtraction at $(v,Q^2)=(iQ,Q^2)$ rather than $(0,Q^2) \implies$ Main non-Born contribution contained in the subtraction function See Franziska Hagelstein's talk this morning

- Our lattice calculation also favors this subtraction point
 - Statistical errors are reduced Less requirement for the computation of hadronic function, only H_{ii}

Evaluate the subtraction function

- Conventional subtraction function used in dispersion relation contains only the inelastic contribution
- > Lattice results $@m_{\pi}=142$ MeV, with elastic and inelastic terms

- Separating elastic part requires the calculation of momentum dependence of form factors
- \succ Contribute <10% to the total TPE
- With disconnected diagrams, elastic + inelastic part consistent with 0

From Lamb shift to hyperfine splitting

Hyperfine splitting arises from proton magnetic moment interacting with the magnetic field generated by the lepton

- Hydrogen 21cm line comes from hyperfine splitting
 - It marked the birth of spectral-line radio astronomy
 - In 1952 the first maps of hydrogen in the Galaxy were made and the spiral structure of the Milky Way was revealed

- > Largest theoretical uncertainty to determine hyperfine splitting also originates from TPE
- Lamb shift is related to charge radius, while hyperfine splitting is related to proton magnetic moment. Thus in many aspects e.g. computational method and IR structure, they're quite different.

Another interesting theoretical research work!

From Lamb shift to hyperfine splitting

Hydrogen hyperfine splitting
A. Antognini, F. Hagelstein, V. Pascalutsa, Ann. Rev. Nucl. Part. Sci. 72 (2022) 389

 $\Delta E_{\text{HFS}}(1S) = (1 + \Delta_{\text{structure-indep.}} + \Delta_{\text{TPE}}) \times E_{\text{Fermi}}(1S)$ $= (1 + 1136.861(2) \times 10^{-6} - 32.6(8) \times 10^{-6}) \times 1418840.1 \text{ kHz}$ About E_{Fermi} see Carl Carlson's tak this morning

TPE contribution comes from dispersive analysis

> Lattice results @ m_{π} =142 MeV, a=0.194 fm - hydrogen (left), muonic hydrogen (right)

Dispersive results from O. Tomalak, Eur. Phys. J. A 55 (2019) 64

Electric polarizability from lattice QCD

Previous calculations are performed at unphysical pion mass, ranging from 227 – 759 MeV

External E&M field are incorporated as background

□ Only two-point correlation are required

- □ Uniform E&M field distorted by finite volume
 - Quantized value for field \rightarrow not so weak
 - Dirichlet boundary condition → tune the point to reduce the effects caused by the boundary

Extract polarizability directly from Compton tensor

Also suggested by Frank Lee's talk on Tuesday

Summary by Franziska Hagelstein, Symmetry 12 (2020) 1407

Electric polarizability from lattice QCD

Unpolarized VVCS

$$T^{\mu\nu} = \int d^4x e^{i\mathbf{q}\cdot\mathbf{x}} \langle p|\mathcal{T}[J^{\mu}(t,\mathbf{x})J^{\nu}(0)]|p\rangle = T^{\mu\nu}_{Born} + \frac{2M}{\alpha_{em}}[-\beta_M \mathcal{K}_1^{\mu\nu} + (\alpha_E + \beta_M)\mathcal{K}_2^{\mu\nu}]$$

▶ Set up momentum for proton $P = (M, \mathbf{0})$ and photon $q = (0, \boldsymbol{\xi})$

$$\frac{2M}{\alpha_{em}}\alpha_E^N = \left(\frac{\partial T^{00}}{\partial \xi^2} - \frac{\partial T^{00}_{Born}}{\partial \xi^2}\right) \bigg|_{\xi \to 0}$$

 \succ For proton

$$\frac{2M}{\alpha_{em}}\alpha_E = \frac{1}{2M^2} + \frac{2}{3}\langle r_E^2 \rangle + \frac{\kappa^2}{2M^2} + \left(\frac{t_s}{M} + t_s^2 + \frac{4}{3}M\langle r_E^2 \rangle t_s\right) + \int_{|t| < t_s} d^4x \left(-\frac{|\mathbf{x}|^2}{6}\right) H(\mathbf{x}, t)$$

Long-distance part

$$\frac{2M}{\alpha_{em}} \alpha_E^{(n)} = \frac{\kappa_{(n)}^2}{2M^2} + \int_{|t| < t_s} d^4x \left(-\frac{|\mathbf{x}|^2}{6}\right) H_{(n)}(\mathbf{x}, t)$$

Short-distance part

Lattice results for proton electric polarizability

$$\frac{2M}{\alpha_{em}}\alpha_{E} = \frac{1}{2M^{2}} + \frac{2}{3}\langle r_{E}^{2} \rangle + \frac{\kappa^{2}}{2M^{2}} + \left(\frac{t_{s}}{M} + t_{s}^{2} + \frac{4}{3}M\langle r_{E}^{2} \rangle t_{s}\right) + \int_{|t| < t_{s}} d^{4}x \left(-\frac{|\mathbf{x}|^{2}}{6}\right) H(\mathbf{x}, t)$$

$$= \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right]_{1}^{1} \left[\begin{bmatrix} 1 \\ 0 \\$$

Maximal source-sink separation T+2a is 1.16 fm and 0.86 fm, respectively

Long-distance contribution reproduces charge radius

 \blacktriangleright Charge radius from 4-point correlation function is noisy, but consistent with μ H value

Lattice results for neutron electric polarizability

- > Much smaller value for neutron electric polarizability
- > Add disconnected diagram, increase statistics and further reduce systematics

Future directions to explore

➢ Q²-dependence of E&M polarizability for VVCS

➢ Q²-dependence of E&M polarizability for VCS
