

DAQ software implementation in the TileCal ALTI Module

Humphry Tlou

School of Physics and Institute for Collider Particle Physics, University of the
Witwatersrand, Johannesburg, Wits 2050, South Africa

January 31, 2020

Overview

- 1 The Tile Calorimeter
- 2 Back-End read-out electronics
- 3 ALTI Module
- 4 ALTI Schematics
- 5 Tile Online software
- 6 Dependence graph
- 7 TileALTI GitLab project
- 8 Summary

The Tile Calorimeter

- Central hadronic calorimeter ($|\eta| < 1.7$) in ATLAS detector
- Mechanically partitioned into 3 barrels, 2 extended barrels and 1 central long barrel
- Split into 4 partitions, 2 in long barrel and 1 for each extended barrel
- Each barrel is assembled out of 64 wedge-shaped modules staggered in the ϕ direction
- Each module is made up of steel and scintillating plastic tiles
- Double photomultiplier readout using wave length shifting fibers

Back-End read-out electronics

- The TileCal BE read-out electronics in the ATLAS USA15 counting room consist of four partitions, while B175 test bench consists of one partition.

TTC crate in the test bench

- ATLAS is replacing the ageing Timing Trigger and Control (TTC) hardware with newer electronics

Main issues:

- new sub-detectors for the Phase-1 upgrade require TTC modules
- low on spares, just barely reaching the 10% per module type
- the TTC modules are now very old (>15 years) with obsolete components
- not possible to re-produce modules for new sub-detectors and for stocking-up spares cupboard
- ALTI (ATLAS Local Trigger Interface) module replaces the 4 legacy modules in the TTC crate (LTP, LTPi, TTCvi, TTCex)

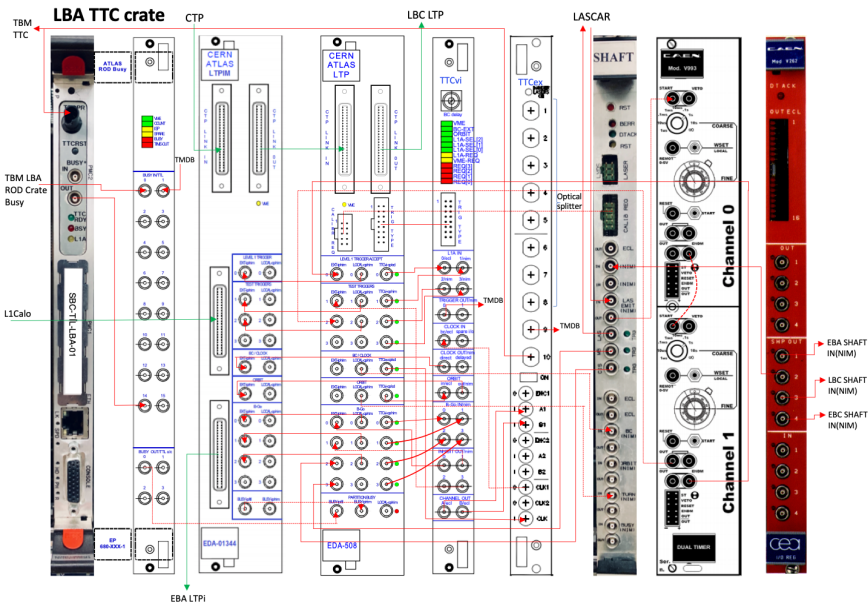

Main task:

- update the Tile Online software in order to make use of the ALTI board for the TTC and drawer configuration
- Run tests in B175 test bench and later in the USA15 counting room

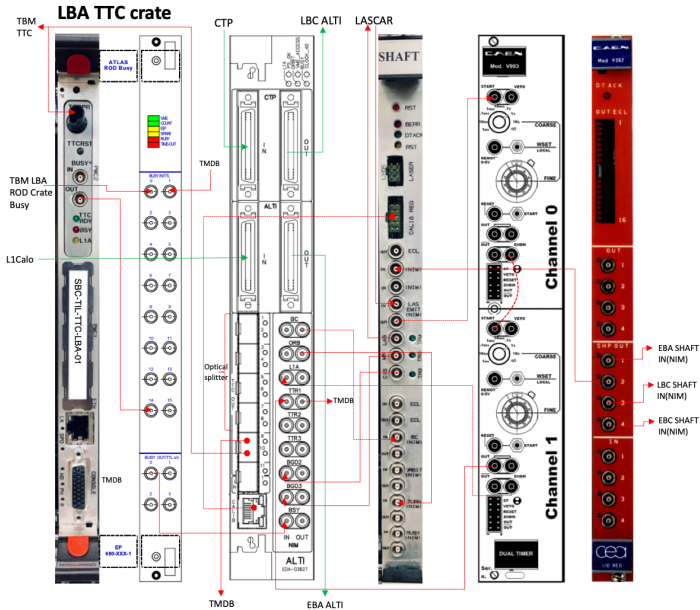

ALTI Schematics

- LTPi, LTP, TTCvi, TTCex and the ALTI module

- 4 of the TTC legacy modules, to be replaced with the ALTI module

- Functionalities of the 4 modules, integrated into the ALTI module

A set of TDAQ software used for the operation of the Tile Calorimeter. It is built up of CMake packages which are stored in Gitlab (atlas-tile-online)

Tile Online Release projects are built on the TDAQ release

tile-07-01-02 on tdaq-07-01-00 [x86_64-slc6-gcc62-opt]

- Used in 2017/2018 data taking, HLT based on off-line 21.1.*
- To continue using it during LS2
- /afs/cern.ch/user/t/tiledaq/public/tilercd/tile-7.1.0.2

tile-8.2.0.0 [x86_64-slc6-gcc8-opt]

- LCG 95, HLT 22.0.1/2
- Includes ALTI package
- /afs/cern.ch/user/t/tiledaq/public/tilercd/tile-8.2.0.0
- /afs/cern.ch/atlas/project/TicalOnline/tilercd/tile-8.2.0.0 (B175 test bench)

tile-8.3.1.0 [x86_64-centos7-gcc8-opt] → B175 test bench

- LCG 96, HLT 22.0.3
- Includes ALTI package
- /afs/cern.ch/atlas/project/TicalOnline/tilercd/tile-8.3.1.0

Next after **tdaq-08-03-01** is **tdaq-09-*** in 2020

B175 ROD lab machines migrated from SLC 6 to CentOS 7

Plan to migrate all TileCal machines to CentOS 7

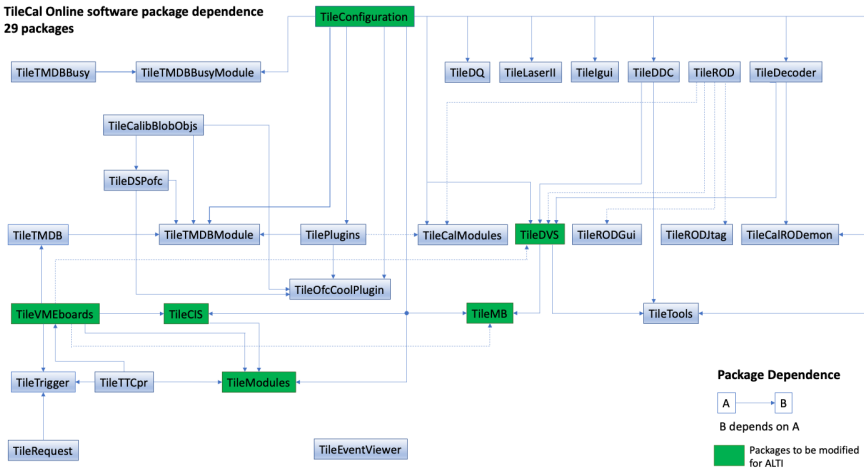

The ALTI software is organised into two levels:

- low-level software, including test and menu programs:
<https://gitlab.cern.ch/atlas-tdaq-software/ALTI>
- high-level software: DAQ controller:
<https://gitlab.cern.ch/atlas-tdaq-software/AltiController>

Tools: C++ and OKS (Object Kernel Support) -an object oriented database with storage based on XML

⏪ Collapse sidebar

In general ALTI replaces the functionality of TTCvi and LTP boards. Hence 'TileTTC' class compatible with TTCvi and ALTI modules has been added.

'TileTTC' includes constructor with next arguments:

```
TileTTC(int ttcBoardType, int ch, unsigned long addr, unsigned int slot,  
bool useDVS = false, unsigned int tm=10000);
```

where:

- 'ttcBoardType' = 0' - ttcvi functionality, '1' - ALTI
- ch - channel as in ttcvi class, but for ALTI could be only: 0 - L1A, 1 - TTR1, 2 - TTR2, 3 - TTR3
- addr - VME address only for ttcvi, if 'ttcBoardType = 1' addr is not used at all
- slot - slot number only for ALTI, if 'ttcBoardType = 0' slot is not used at all
- 'useDVS = true' - standalone configuration of ALTI for all tests during reset() function. Implemented in the same way as in AltiController for AltiModeAltiMaster. During normal run 'useDVS = false' we will use AltiController to configure and control all other functionality as LTP, BCR etc.

Summary

- ALTI module to replace the 4 legacy TTC modules
- Schematics for the connections within the TTC crates are now available for anyone who wants to make use of them
- ALTI software package included Tile release tile-8.2.0.0 and tile-8.3.1.0
- B175 ROD lab machines migrated from SLC 6 to CentOS 7
- Modifications of the packages, stored in the TileCal GitLab project
- To perform tests and assess the performance of the ALTI module in 2020
