News from CERN

- there was a power cut on Saturday

- comm rack and crates now are back ON

- nPDM GBTx configured, but I did not get the standard message "Idle 18h" but something like: "WaitDSEL A0 h" → should be checked

- daqux01 not reachable yet.... (this morning at 9:30), Loic is informed and is working on that (already yesterday afternoon...). if nothing happens I'll ask again Loic.

- Federico Alessio and Paolo Durante installed another PCIe40 in "our" server, will be used by CALO → take that into account from now on (multiple boards in the same server)
