# Time Alignment

- Where I was: I can run Giacomo's code up until the end (run over data and get corrections)
- Where I am: I manage to port all the c++ code to the latest implementation of the framework. It compiles and it can be run but it fails to find things such as database slices etc. But this is a problem with the options not the c++ itself
- Noe I am working on the options, old ones were still in ".opts" format (for who remembers). Converting them to python is not as easy as I thought, many things do not exist anymore or changed their name..
