## Abstract

The quark-parton model calculation including the effects of intrinsic transverse momentum and of all six twist-two distribution functions of quarks in polarized nucleons is performed. It is demonstrated that new twist-two quark distribution functions and polarized quark fragmentation functions can be investigated in semi-inclusive DIS at leading order in  $Q^2$ . The general expression for the cross-section of semi-inclusive DIS of polarized leptons on polarized nucleons in terms of structure functions is also discussed.

### Abstract

Semi-inclusive leptonproduction,  $\ell + p \rightarrow \ell' + h + X$ , is considered in the naive parton model. The scattered parton shows an azimuthal asymmetry about the momentum transfer direction. Simple derivations for the effects in ep,  $\nu p$  and  $\bar{\nu} p$  scattering are given. Reduction of the asymmetry due to fragmentation of partons into hadrons is estimated. The results cast doubt on the utility of such azimuthal asymmetry as a clean test of quantum chromodynamics.

## ABSTRACT

The role of intrinsic  $k_{\perp}$  in inclusive and semi-inclusive Deep Inelastic Scattering processes ( $\ell p \rightarrow \ell h X$ ) is studied with exact kinematics within QCD parton model at leading order; the dependence of the unpolarized cross section on the azimuthal angle between the leptonic and the hadron production planes (Cahn effect) is compared with data and used to estimate the average values of  $k_{\perp}$  both in quark distribution and fragmentation functions. The resulting picture is applied to the description of the weighted single spin asymmetry  $A_{UT}^{\sin(\phi_{\pi}-\phi_S)}$  recently measured by the HERMES collaboration at DESY; this allows to extract some simple models for the quark Sivers functions. These are compared with the Sivers functions which succeed in describing the data on transverse single spin asymmetries in  $p^{\uparrow} p \rightarrow \pi X$  processes; the two sets of functions are not inconsistent. The extracted Sivers functions give predictions for the COMPASS measurement of  $A_{UT}^{\sin(\phi_{\pi}-\phi_S)}$  in agreement with recent preliminary data, while their contribution to HERMES  $A_{UL}^{\sin\phi_{\pi}}$  is computed and found to be small. Predictions for  $A_{UT}^{\sin(\phi_K-\phi_S)}$  for kaon production at HERMES are also given.

## ABSTRACT

The most recent data on the weighted transverse single spin asymmetry  $A_{UT}^{\sin(\phi_h - \phi_S)}$  from HERMES and COMPASS Collaborations are analyzed within the LO parton model with unintegrated parton distribution and fragmentation functions; all transverse motions are taken into account, with exact kinematics, in the elementary interactions. The overall quality of the data is such that, for the first time, a rather well constrained extraction of the Sivers function for  $u$  and  $d$  quarks is possible and is performed. Comparisons with models are made. Based on the extracted Sivers functions, predictions for  $A_{UT}^{\sin(\phi_h - \phi_S)}$  asymmetries at JLab are given; suggestions for further measurements at COMPASS, with a transversely polarized hydrogen target and selecting favorable kinematical ranges, are discussed. Predictions are also presented for single spin asymmetries in Drell-Yan processes at the Relativistic Heavy Ion Collider and the Facility for Antiproton and Ion Research at GSI-Darmstadt.

## ABSTRACT

In the leading order of QCD parton model of semiinclusive deep inelastic scattering (SIDIS) the double spin asymmetry  $A_{LT}$  arises due to the longitudinal polarization of quarks in the transversely polarized nucleon. The corresponding  $k_T^2$  weighted distribution function  $g_{1T}^{(1)}$  can be related to ordinary helicity distribution  $g_1(x)$  measured in DIS. Using recent parametrizations for (un)polarized distribution and fragmentation functions we calculated  $A_{LT}$  asymmetry on transversely polarized proton and deuteron targets for different types of hadron production. The predictions are given for COMPASS, HERMES, and JLab energies. The role of Lorentz invariance relations and positivity constraints are discussed.

### ABSTRACT

A global analysis of the experimental data on azimuthal asymmetries in semi-inclusive deep inelastic scattering (SIDIS), from the HERMES and COMPASS Collaborations, and in  $e^+e^- \rightarrow h_1 h_2 X$  processes, from the Belle Collaboration, is performed. It results in the extraction of the Collins fragmentation function and, *for the first time*, of the transversity distribution function for  $u$  and  $d$  quarks. These turn out to have opposite signs and to be sizably smaller than their positivity bounds. Predictions for the azimuthal asymmetry  $A_{UT}^{\sin(\phi_S+\phi_h)}$ , as will soon be measured at JLab and COMPASS operating on a transversely polarized proton target, are then presented.

## ABSTRACT

---

We present the complete cross-section for the production of unpolarized hadrons in semi-inclusive deep-inelastic scattering up to power-suppressed  $\mathcal{O}(1/Q^2)$  terms in the Wandzura-Wilczek-type approximation, which consists in systematically assuming that  $\bar{q}gq$ -terms are much smaller than  $\bar{q}q$ -correlators. We compute all twist-2 and twist-3 structure functions and the corresponding asymmetries, and discuss the applicability of the Wandzura-Wilczek-type approximations on the basis of available data. We make predictions that can be tested by data from COMPASS, HERMES, Jefferson Lab, and the future Electron-Ion Collider. The results of this paper can be readily used for phenomenology and for event generators, and will help to improve the description of semi-inclusive deep-inelastic processes in terms of transverse momentum dependent parton distribution functions and fragmentation functions beyond the leading twist.

## ABSTRACT

Accounting for transverse momenta of the quarks, a longitudinal quark spin asymmetry exists in a transversely polarized nucleon target. The relevant leading quark distribution  $g_{1T}(x, k_T^2)$  can be measured in semi-inclusive deep-inelastic scattering. The average  $k_T^2$  weighted distribution function  $g_{1T}^{(1)}$  can be obtained directly from the inclusive measurement of  $g_2$ .

## Abstract

We consider the leading order result for polarized leptonproduction, putting emphasis on transverse momentum dependent effects appearing in azimuthal asymmetries.

Measurements of weighted cross sections enable extraction of the distribution of transversely polarized quarks. We focus on the distribution in a longitudinally polarized hadron and estimate the expected asymmetries in leptonproduction.
