

Analysis of the management of conference presentations in the CMS collaboration

Presentation of the achievements and results to the community of reference in conferences and workshops is a major duty of any scientific collaboration. Large collaborations face the issue of ensuring at the same time the highest quality, a proper recognition of the work done by its members and an adequate representation of all the contributing bodies and institutions, and of the diversity of the collaboration. In this talk, we summarise the procedures for the management of conference presentations adopted by the CMS collaboration at the CERN Large Hadron Collider and the statistical analysis of an unprecedented sample of 13 years of talks and posters at national and international events. Good practices and critical points will be highlighted and discussed.
