NuFact 2021: The 22nd International Workshop on Neutrinos from Accelerators

Contribution ID: 161

Type: Oral

## Latest results from NOvA

Wednesday 8 September 2021 12:40 (22 minutes)

NOvA is a long-baseline neutrino oscillation experiment. Its large tracking calorimeters can detect and identify muon and electron neutrino interactions with high efficiency. Neutrinos produced by the NuMI beam are detected by a near detector, located at Fermilab, and a much larger far detector, located 810 km away in Ash River, Minnesota. NOvA can measure the electron neutrino and antineutrino appearance rates, as well as the muon neutrino and antineutrino disappearance rates, in order to constrain neutrino oscillations parameters, including the neutrino mass hierarchy and the CP-violating phase  $\delta$ CP. This talk will present NOvA's latest results combining both neutrino data (13.6×10^20POT) and antineutrino data (12.5×10^20 POT).
