

## **Core-Collapse Supernova neutrinos in DarkSide-20k and Argo**

When a core-collapse supernova (SN) explodes, only 1 % of its energy is released through electromagnetic waves: the rest is emitted via neutrinos. If a galactic supernova will show up during its data taking, DarkSide-20k, a future 50-ton liquid argon dual-phase TPC, designed for the direct detection of dark matter particles, will perform a flavour insensitive detection of SN neutrinos via coherent elastic neutrino-nucleus scattering, (CE  $\nu$  NS), providing additional information on the explosion mechanism. The sensitivity study is extended to Argo, the following future detector, filled with 300 tons of Liquid Argon. Furthermore, by the comparison with a charged current detection, discrimination between neutrino mass orderings, normal or inverted, can be inferred.

### **Working group**

WG6

**Authors:** Mrs LAI, Michela (INFN Cagliari); Dr BONIVENTO, Walter M. (INFN Cagliari); FRANCO, Davide (APC); RENSHAW, Andrew; YE, Ziping

**Presenter:** Mrs LAI, Michela (INFN Cagliari)
