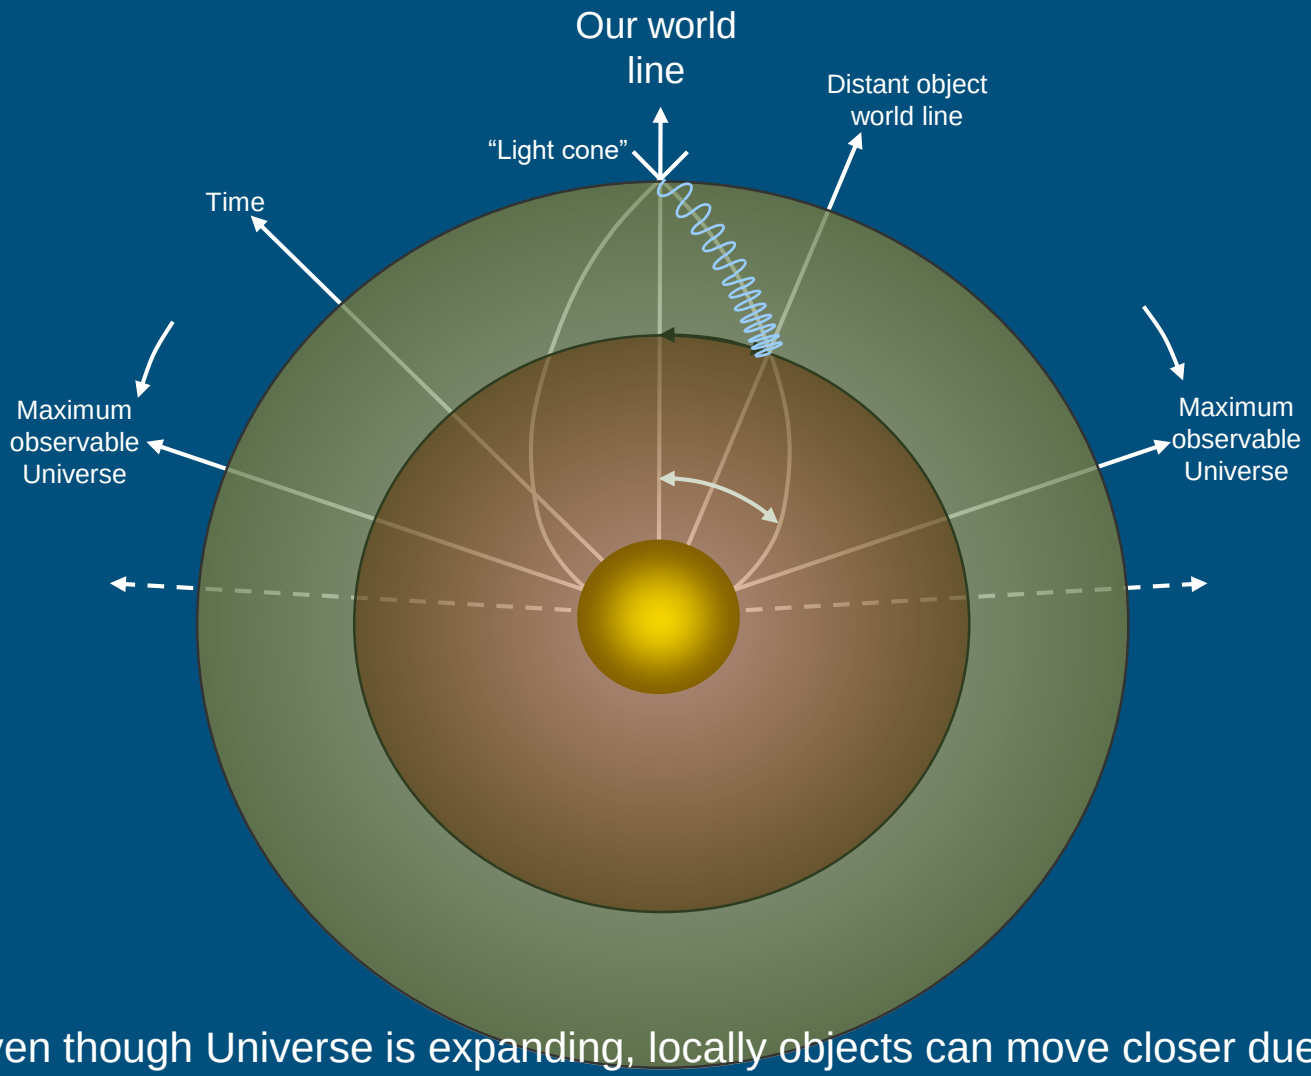
Expansion and the distorsion of the past



- Even though Universe is expanding, locally objects can move closer due to gravity
- Expansion rate depends on radiation, matter, curvature, cosmological constant

13 800 000 000 (billion) years

Age of the Universe = 3 x Age of Earth !

hic sunt dracones

BIG BANG

hic sunt dracones

Universe becomes transparent
380 000 y.
T= 3000 °C
Size 1/1000

First stars light up
100 million y.
T= 20 °C
Size 1/100

Galaxies form
500 million y.
T= -255 °C
Size 1/6

Expansion rate of the Universe starts to accelerate
~5 billion y.
T=-264 °C
Size 1/3

Birth of the Solar system
9 billion y.
T=-267 °C
Size 1/2

13 October 2016
13.7 billion y.
T=-270 °C
Size 1/1

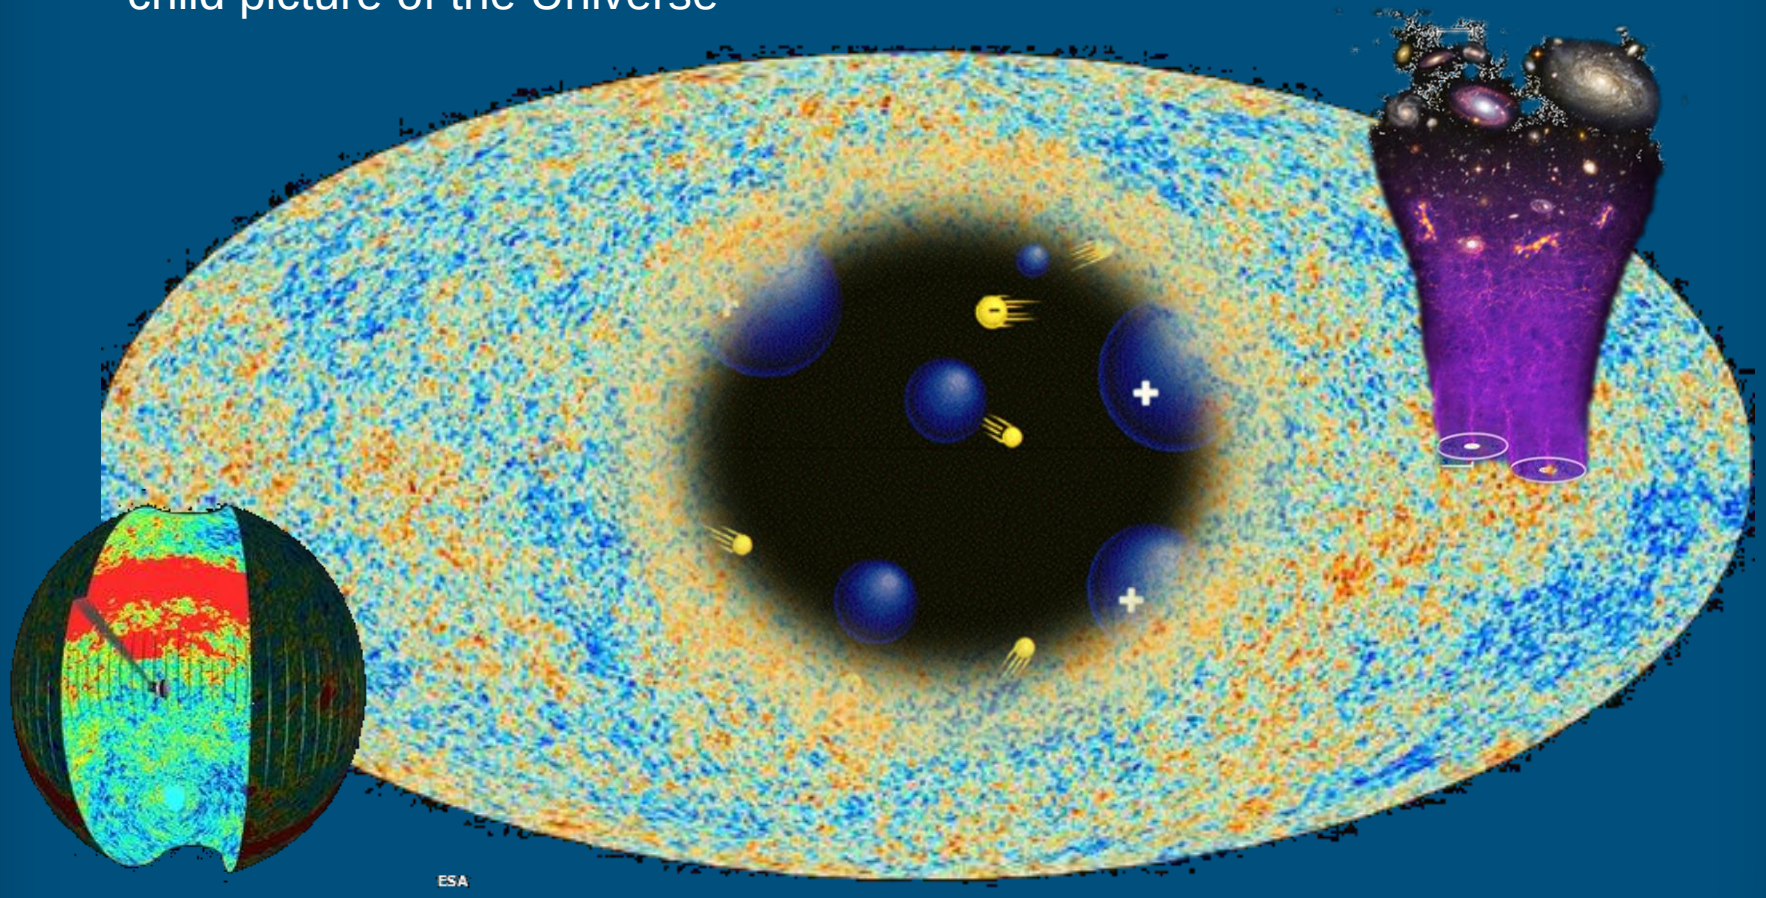
The Big Bang Afterglow

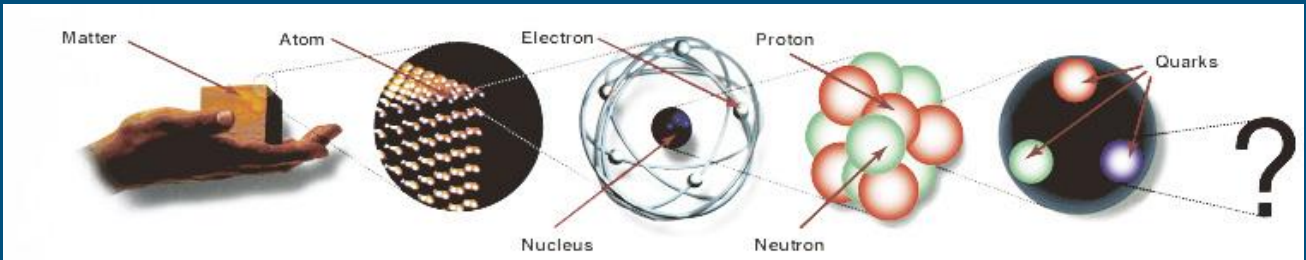
- Universe gets transparent at an age of 380 000 years!
- The Cosmic Microwave Background (CMB) is the first child picture of the Universe



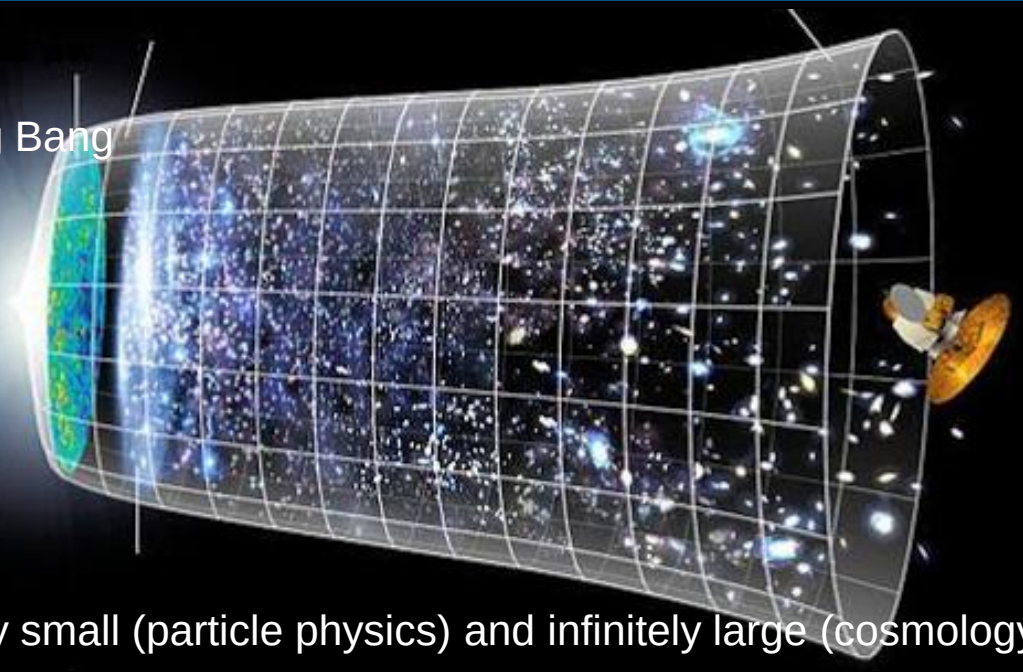
- What is behind the veil?

Particle Physics and Cosmology

- Quest to understand:
  - Fundamental constituents of matter - Matter particles
  - Interactions with which particles act on each other - Interactions
  - Particles propagating the interactions - Messenger particles



- Ultimately describe:
  - Birth of the Universe, the Big Bang
  - Passed and future Evolution

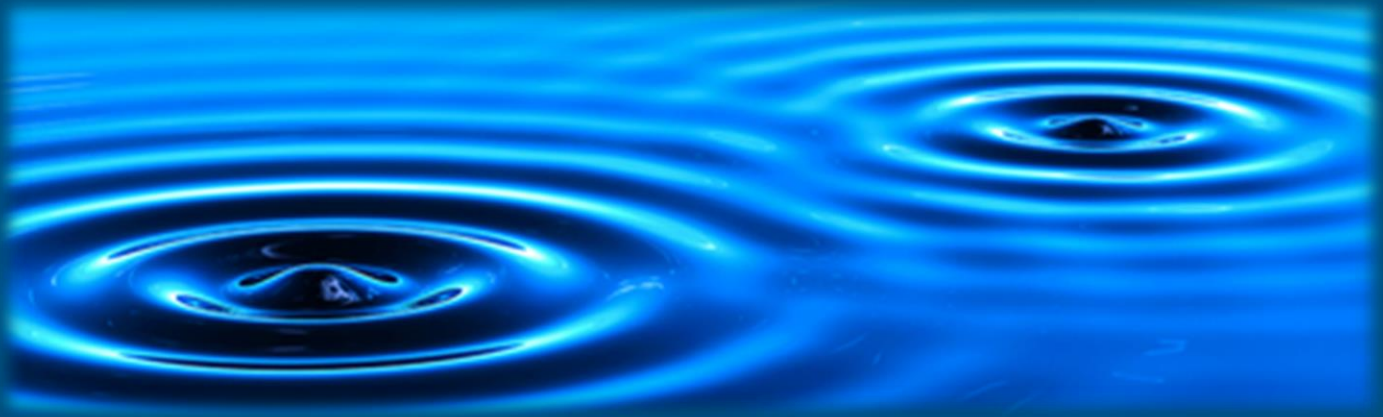


- Strong link between the infinitely small (particle physics) and infinitely large (cosmology)

What is a “fundamental particle”?

A “particle” is a propagation of a quantity of information (properties) perceived through the different interactions (~forces)!

- ➔ That is, particles are perceived differently depending on their properties
- ➔ Technically, in quantum field theory, a matter particle is represented by an excitation of a matter field, and interaction particles by excitation of a interaction field, very similar to the waves on a surface of water



What is the size of a particle?

➔ Analogy: “What is the size of piece of cotton?” ☺

➔ Depends on how much energy you apply to interact with it!

Heisenberg Uncertainty Principle

A tiny little complication though…. with astronomic consequences:

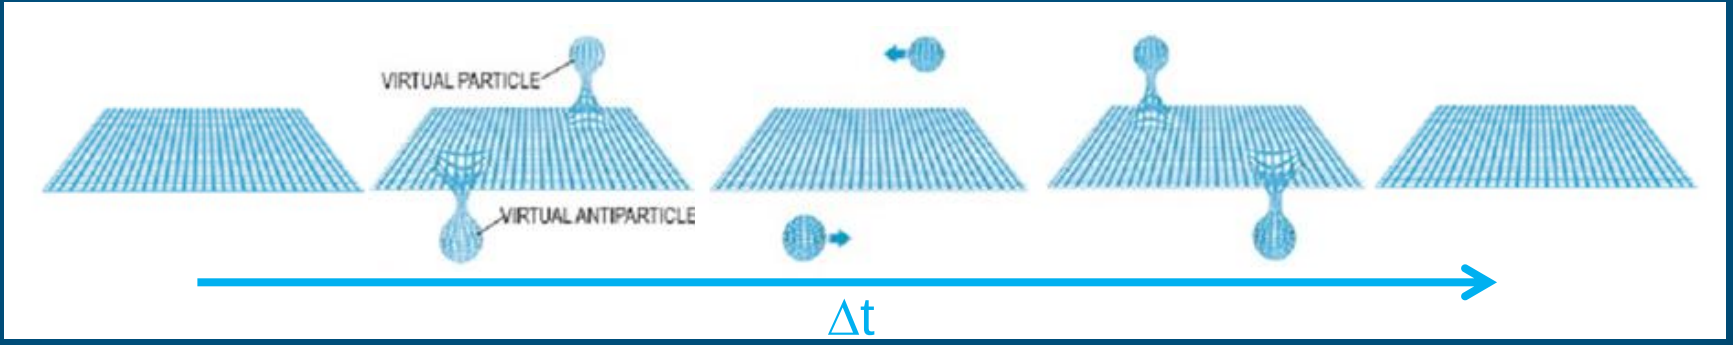
➔ Nature has built in an unavoidable intrinsic randomness:

$$\Delta p \Delta x \leq \frac{h}{2\pi} \qquad \Delta E \Delta t \leq \frac{h}{2\pi}$$

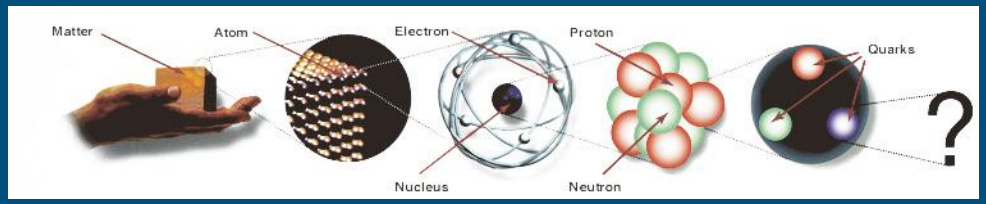
➔

$$\Delta E \leq \frac{h}{2\pi \Delta t}$$

- Vacuum fluctuation = vacuum polarization = virtual particle creation (many names..)



Fundamental constituents of matter (?)



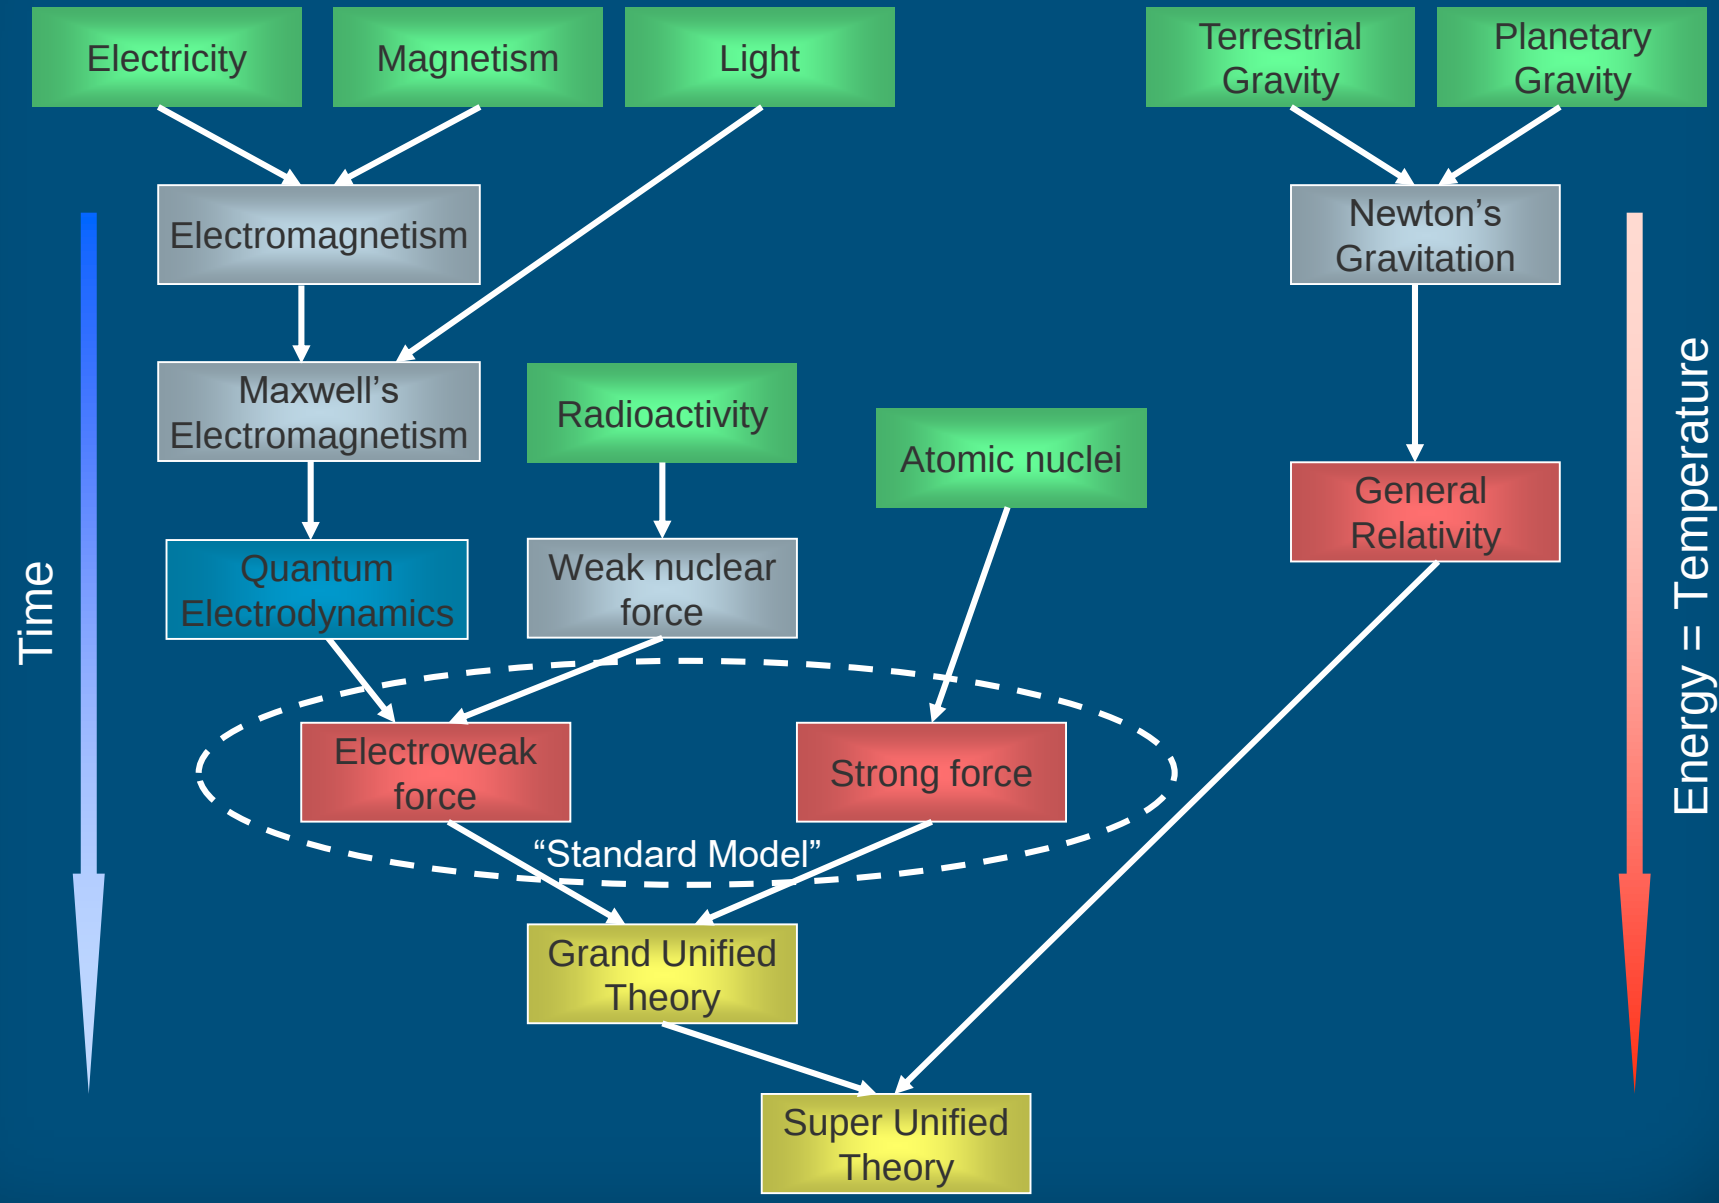
Today's periodic system of the fundamental building blocks

	Quarks		Leptons	
Generation 3	t Top	b Bottom	τ Tau	ν_τ Tau-neutrino
Generation 2	c Charm	s Strange	μ Muon	ν_μ Muon-neutrino
Generation 1	u Up	d Down	e Electron	ν_e Electron-neutrino

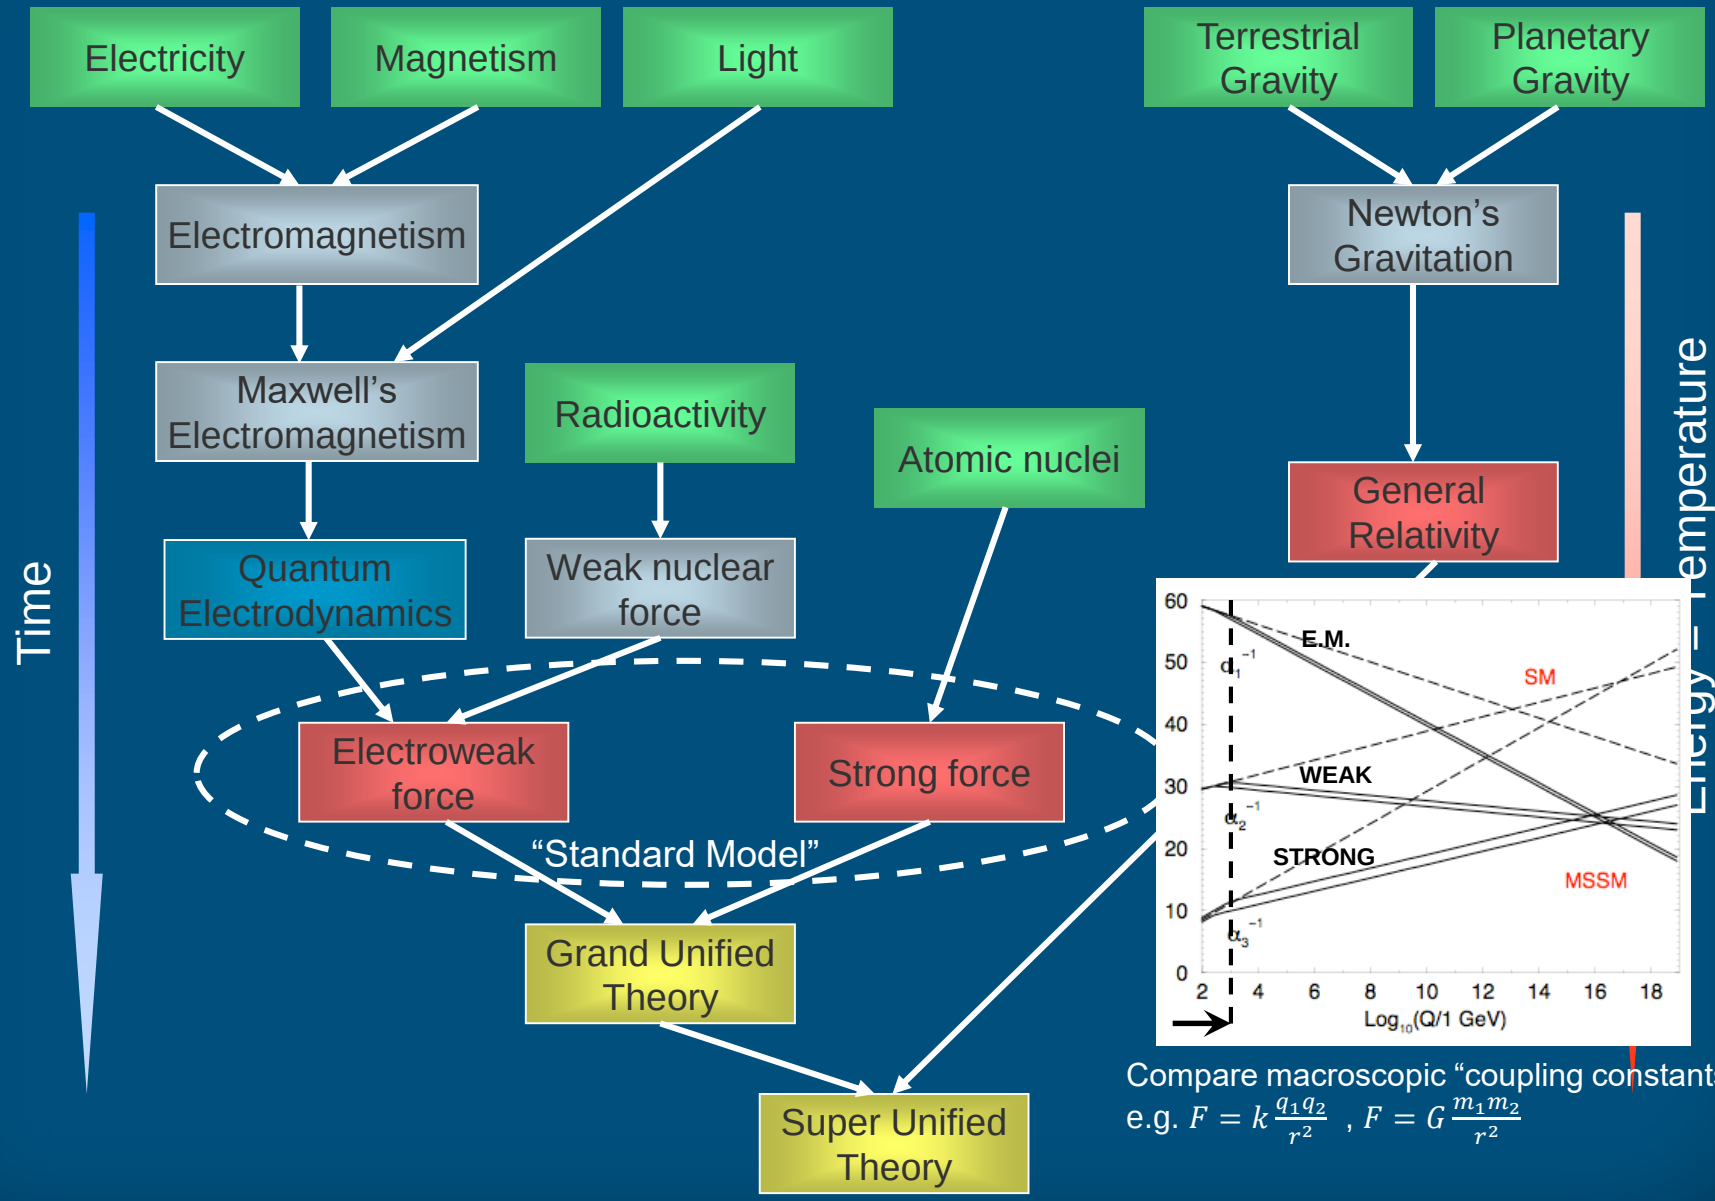
And as many types of anti-particles!

- Note the mass of the fundamental particles
  - 80 kg of human body / $m_{p/n}$(~1.6x10^{-27}kg) * $\Sigma m_{uud/udd}$(~2*10^{-29}kg) = ~1 kg….?
  - .. Rest is kinetic energy and interaction (binding) energy

Interactions (~"forces") and "Unification"

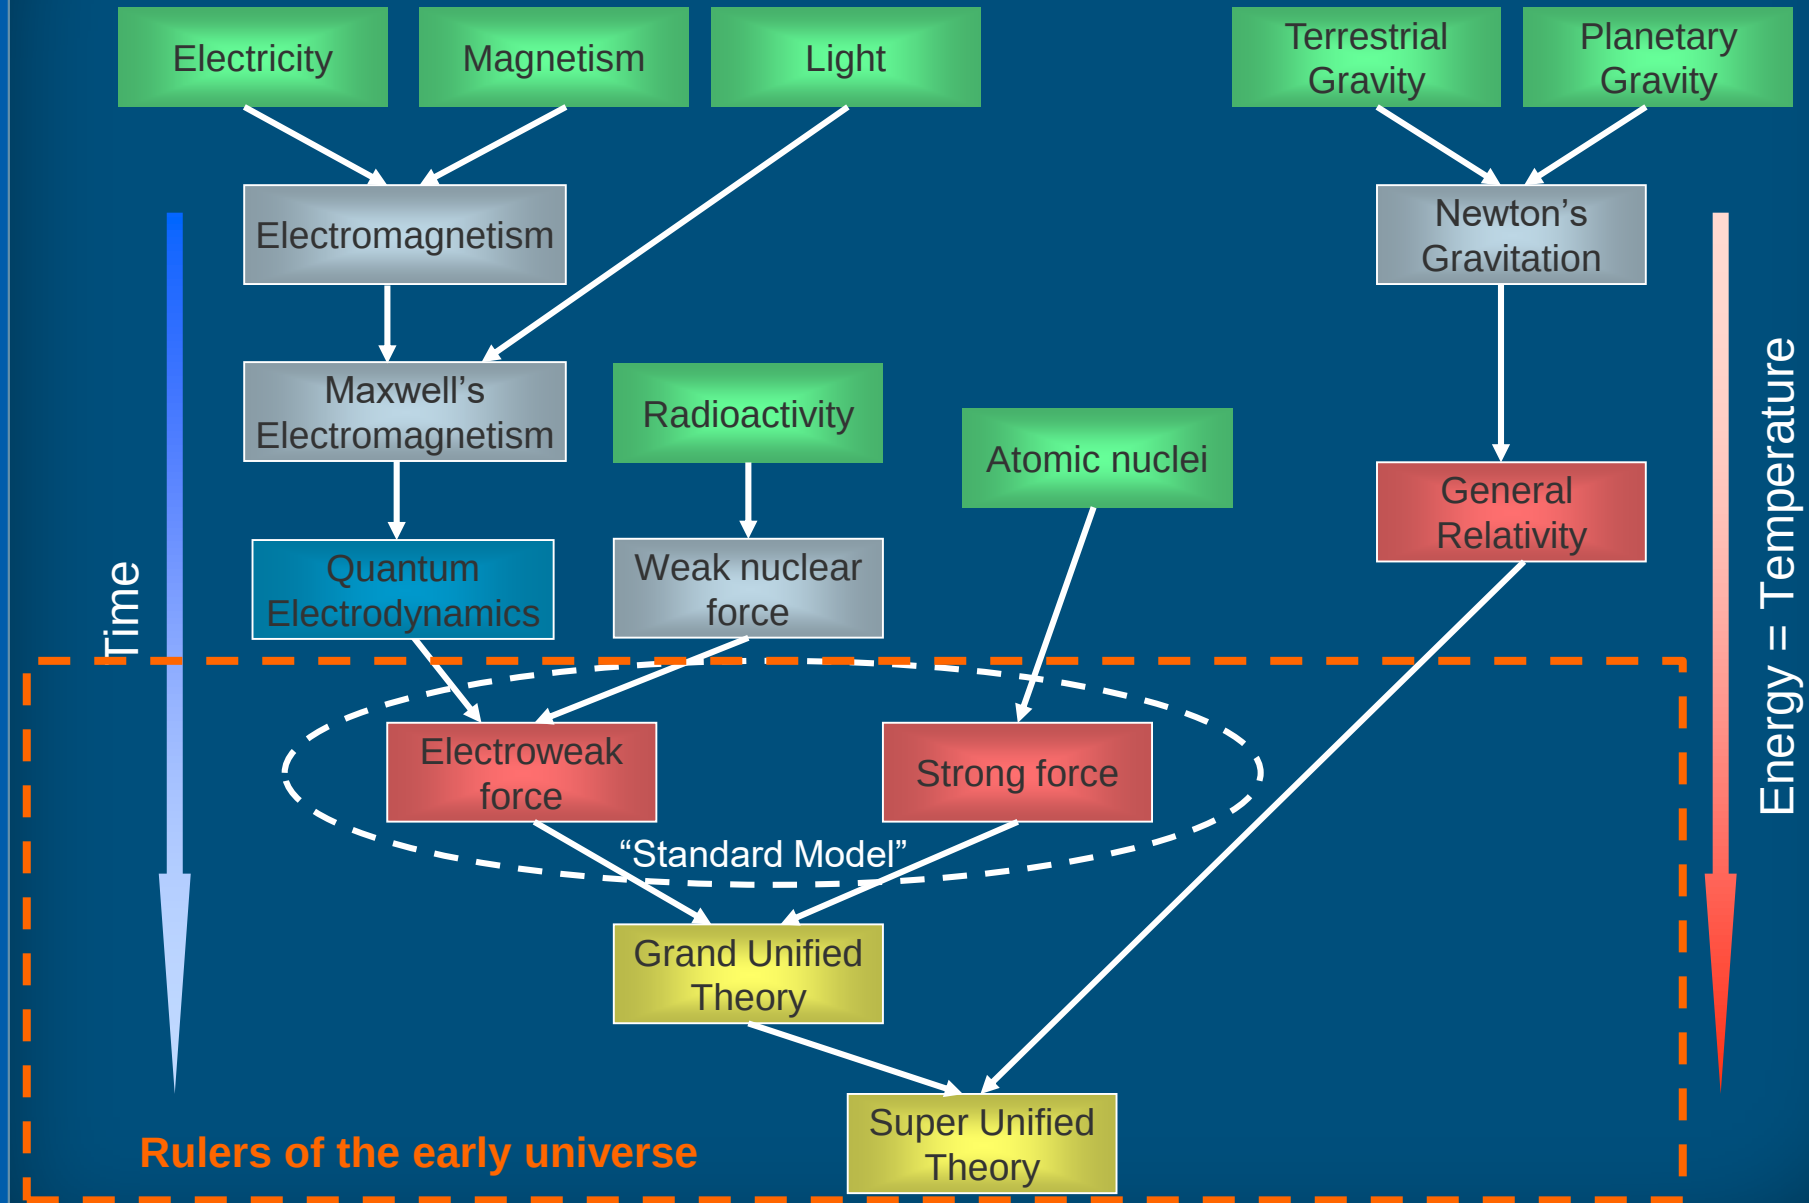


Interactions (~"forces") and "Unification"

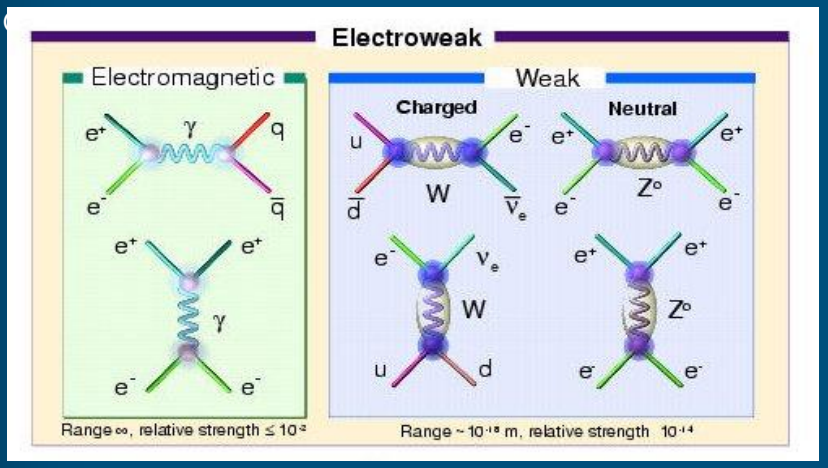


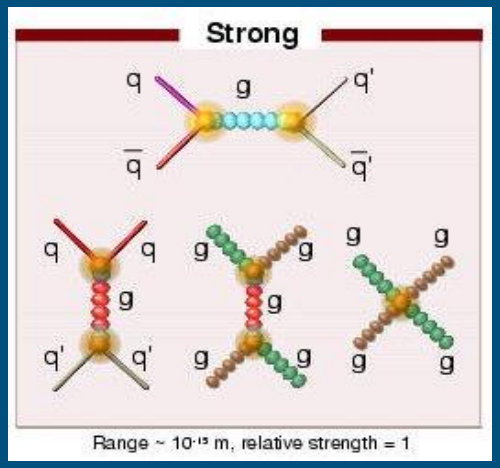
Compare macroscopic "coupling constants", e.g. $F = k\frac{q_1 q_2}{r^2}$, $F = G\frac{m_1 m_2}{r^2}$

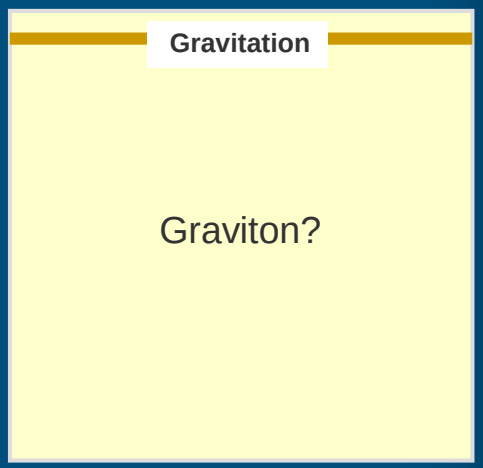
Interactions (~"forces") and "Unification"



Interactions mediators between particles

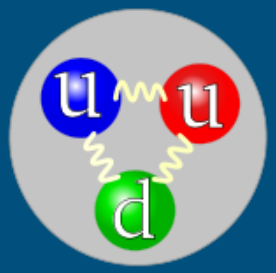




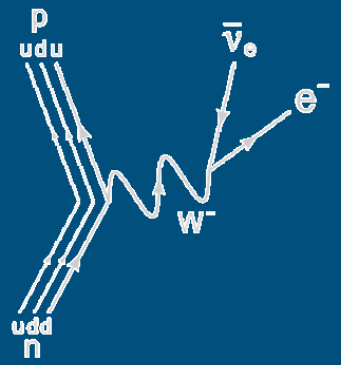


Hadrons

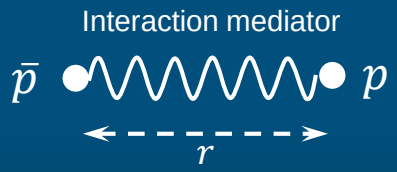
Baryons



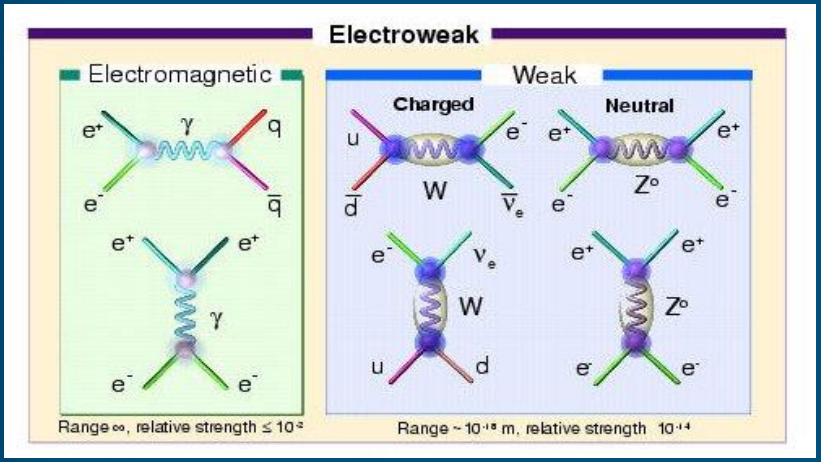
Mesons

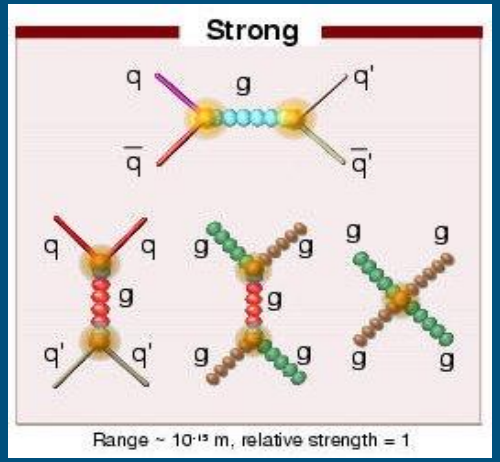


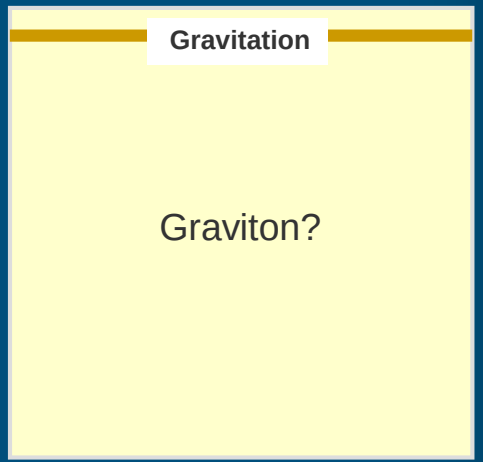
But hey, something weird is going on!
Example, particle – antiparticles at rest:



Interactions between particles

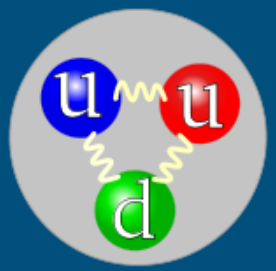




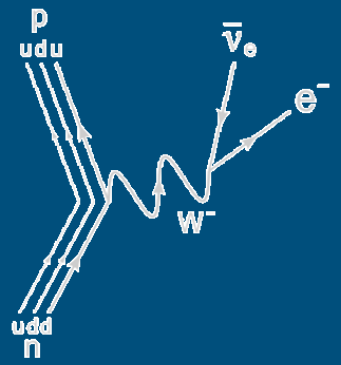


Hadrons

Baryons

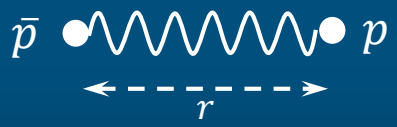


Mesons



But hey, something weird is going on!
Example, particle – antiparticles at rest:

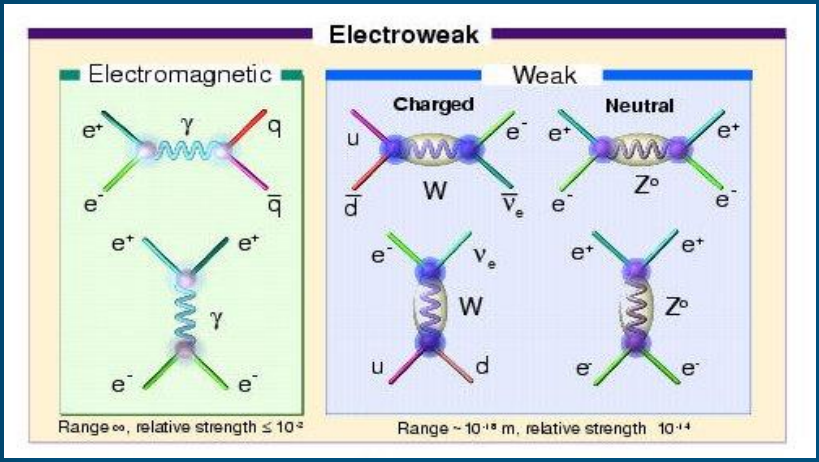
Interaction mediator (e.g. photon)

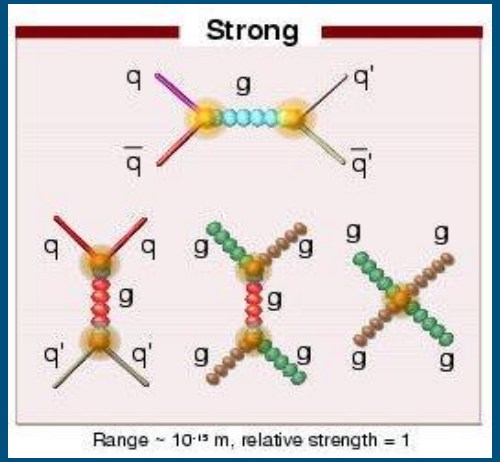


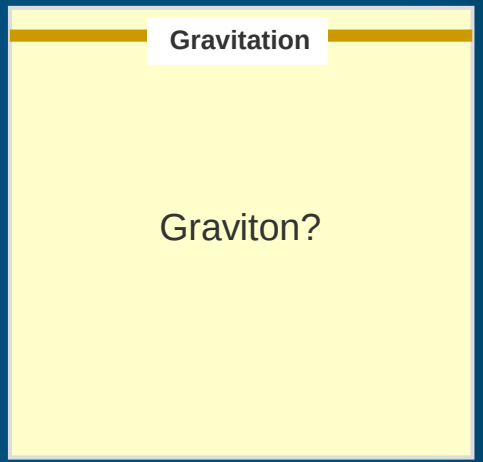
Massless force carrier

$$\Delta E \Delta t \sim E_{int} \frac{r}{c} \leq \frac{h}{2\pi}$$

Interactions between particles

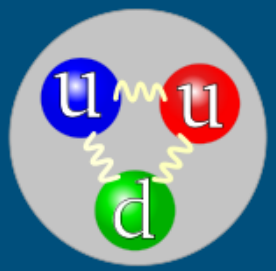




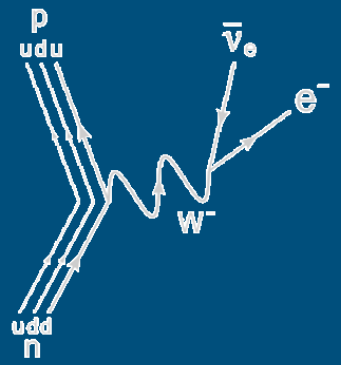


Hadrons

Baryons

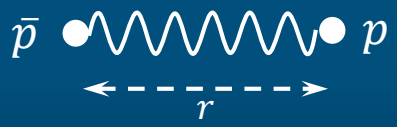


Mesons



But hey, something weird is going on!
Example, particle – antiparticles at rest

Interaction mediator (e.g. Z^0)



Massive force carrier

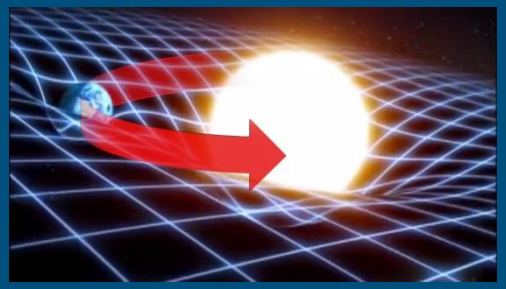
$$\Delta E \Delta t \sim (E_{int} + \langle E_{mass} \rangle) \frac{r}{c} \leq \frac{h}{2\pi}$$

What's so difficult about gravity?

- It's very weak (why so weak!?) and affects the space itself in which it acts…

…that is:

1. Gravity couples to energy and mass and curves space

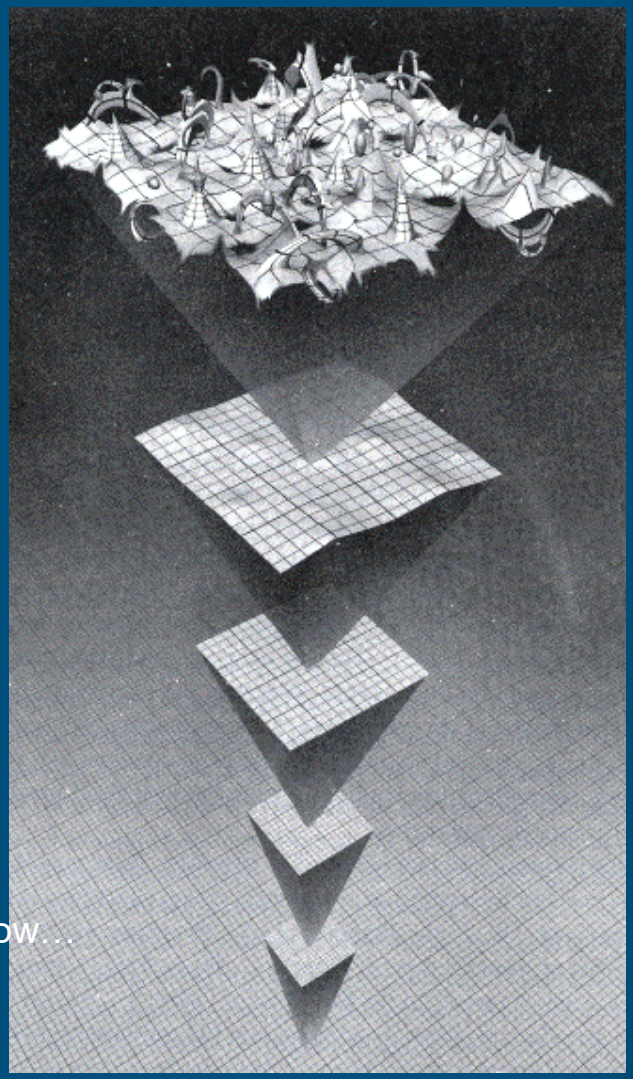


2. Vaccum fluctuations produces virtual mass and virtual energy

3. Gravity will curve space further

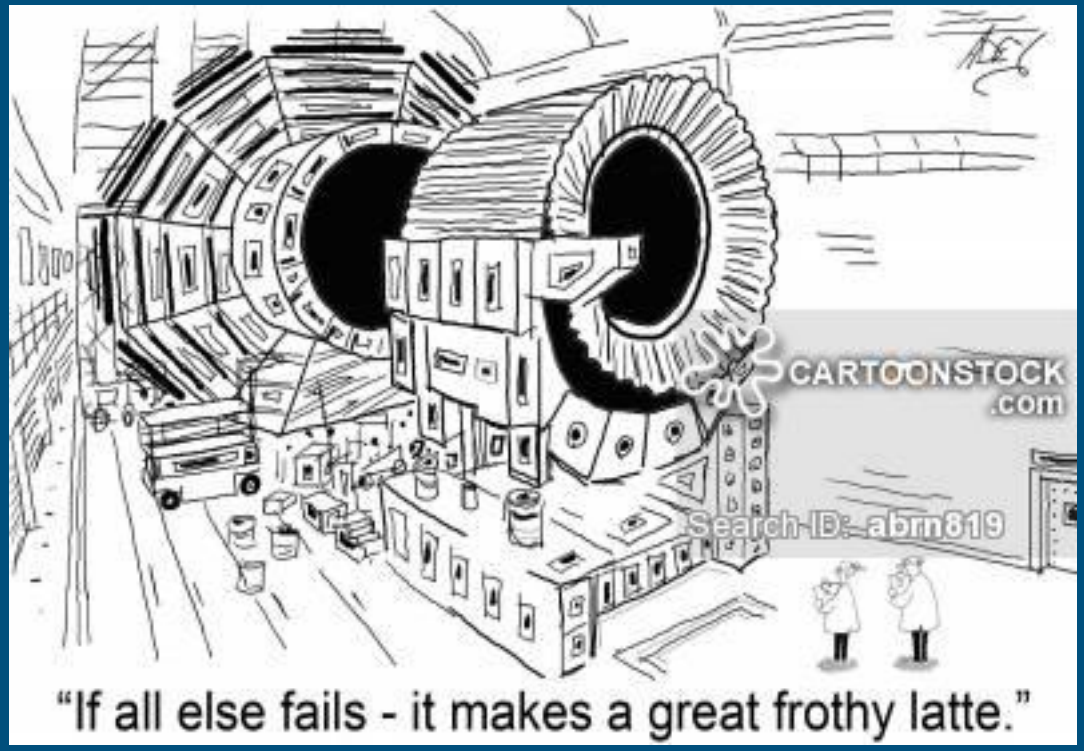
4. The smaller the distances (time-scales),
   the more virtual energy is available,
   the more gravity couples,
   the more the space is curved….
   Leads to infinities…

➔ No way to make a self-consistent quantum gravity theory up to now…

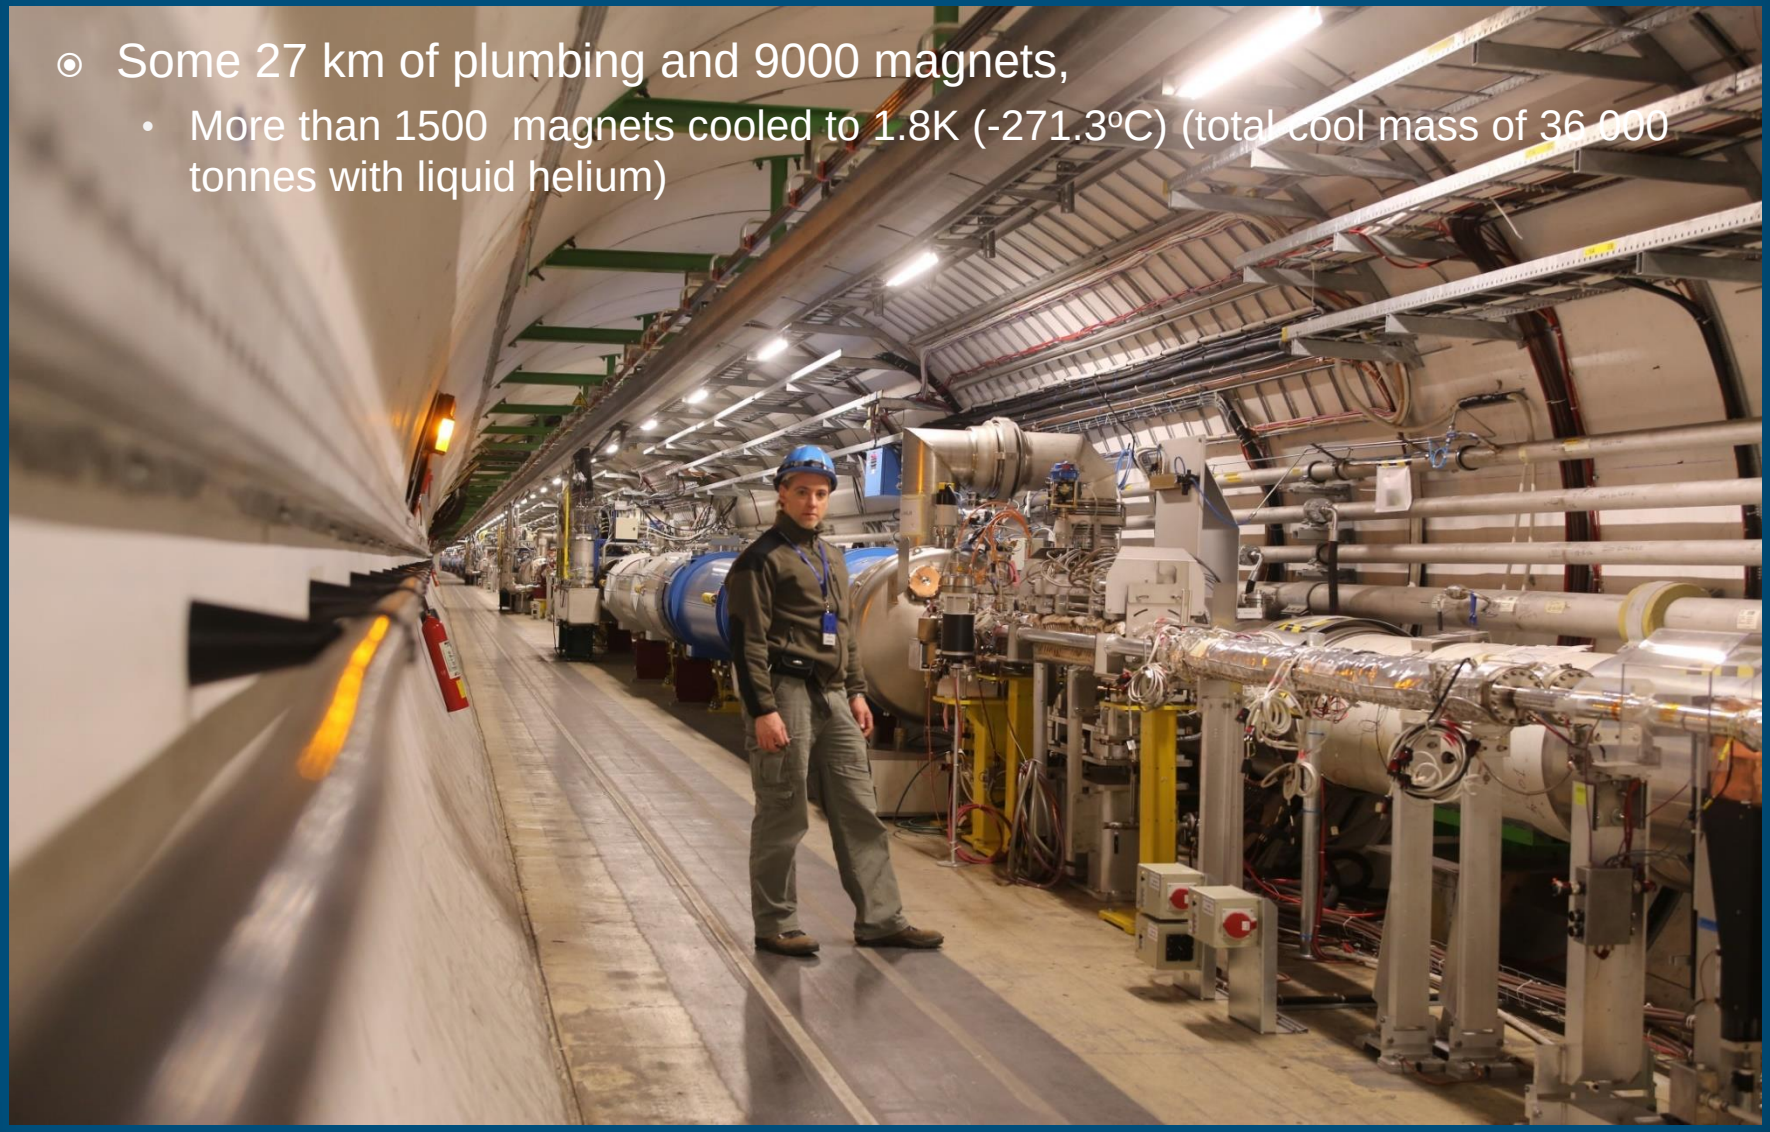


Back to Earth again!

Experimenting with the Big Bang



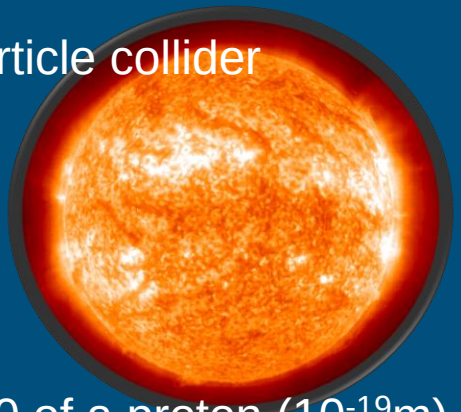
Large Hadron Collider



- Some 27 km of plumbing and 9000 magnets,
  - More than 1500 magnets cooled to 1.8K (-271.3°C) (total cool mass of 36 000 tonnes with liquid helium)

Large Hadron Collider

Large Hadron Collider (LHC) is a 27 km long particle collider



➔ *Recreate* conditions at “small scale”:

- Temperature 10^{16} K that is 1 000 000 000 x

BROKEN SYMMETRIES AND THE MASSES OF

Peter W. Higgs

Tait Institute of Mathematical Physics, University of Edinburgh

(Received 31 August 1964)

currents associated w
group are coupled to gauge fields. T
rpose of the present note is to report that,
as a consequence of this coupling, the spin-one
quanta of some of the gauge fields acquire mass;
the longitudinal degrees of freedom of these par-
icles (which would be absent if their mass were
) go over into the Goldstone bosons when t
tends to zero. This phenomenon

$$L = -\tfrac{1}{2}(\nabla\varphi_1)^2 - \tfrac{1}{2}(\nabla\varphi_2)^2 - V(\varphi_1^2+\varphi_2^2) - \tfrac{1}{4}F_{\mu\nu}F^{\mu\nu}, \quad (1)$$

where

$$\nabla_\mu\varphi_1 = \partial_\mu\varphi_1 - eA_\mu\varphi_2,$$

$$\nabla_\mu\varphi_2 = \partial_\mu\varphi_2 + eA_\mu\varphi_1,$$

$$F_{\mu\nu} = \partial_\mu A_\nu - \partial_\nu A_\mu.$$

e is a dimensionless coupling constant, and the metric is taken as $-+++$. L is invariant under simultaneous gauge transformations of the first kind on $\varphi_1 \pm i\varphi_2$ and of the second kind on A_μ. Let us suppose that $V'(\varphi_0^2)=0$, $V''(\varphi_0^2)>0$; then spontaneous breakdown of U(1) symmetry occurs. Consider the equations [derived from (1) by treating $\Delta\varphi_1$, $\Delta\varphi_2$, and A_μ as small quantities] governing the propagation of small oscillations

about the "vacuum" solution $\varphi_1(x)=0$, $\varphi_2(x)=\varphi_0$:

$$\partial^\mu\{\partial_\mu(\Delta\varphi_1) - e\varphi_0 A_\mu\} = 0, \quad (2a)$$

$$\partial^\mu\partial_\mu(\Delta\varphi_2) - 4\varphi_0^2 V''(\varphi_0^2)(\Delta\varphi_2) = 0, \quad (2b)$$

$$\partial^\mu\{\partial_\mu(\Delta\varphi_1) - e\varphi_0 A_\mu\}. \quad (2c)$$

escribes waves whose quanta have
$_0\{V''(\varphi_0^2)\}^{1/2}$; Eqs. (2a) and (2c)
rmed, by the introduction of new

$$= A_\mu - (e\varphi_0)^{-1}\partial_\mu(\Delta\varphi_1),$$

$$= \partial_\mu B_\nu - \partial_\nu B_\mu = F_{\mu\nu}, \quad (3)$$

$$\partial_\mu B^\mu = 0, \quad \partial_\nu G^{\mu\nu} + e^2\varphi_0^2 B^\mu = 0. \quad (4)$$

quation (4) describes vector waves whose quanta have (bare) mass $e\varphi_0$. In the absence of the gauge field coupling ($e=0$) the situation is quite different: Equations (2a) and (2c) describe zero-mass scalar and vector bosons, respectively. In passing, we note that the right-hand side of (2c) is just the linear approximation to the conserved current: It is linear in the vector potential, gauge invariance being maintained by the presence of the gradient term.[5]

When one considers theoretical models in which spontaneous breakdown of symmetry under a semisimple group occurs, one encounters a variety of possible situations corresponding to the various distinct irreducible representations to which the scala
field always belon
tion.[6] The model

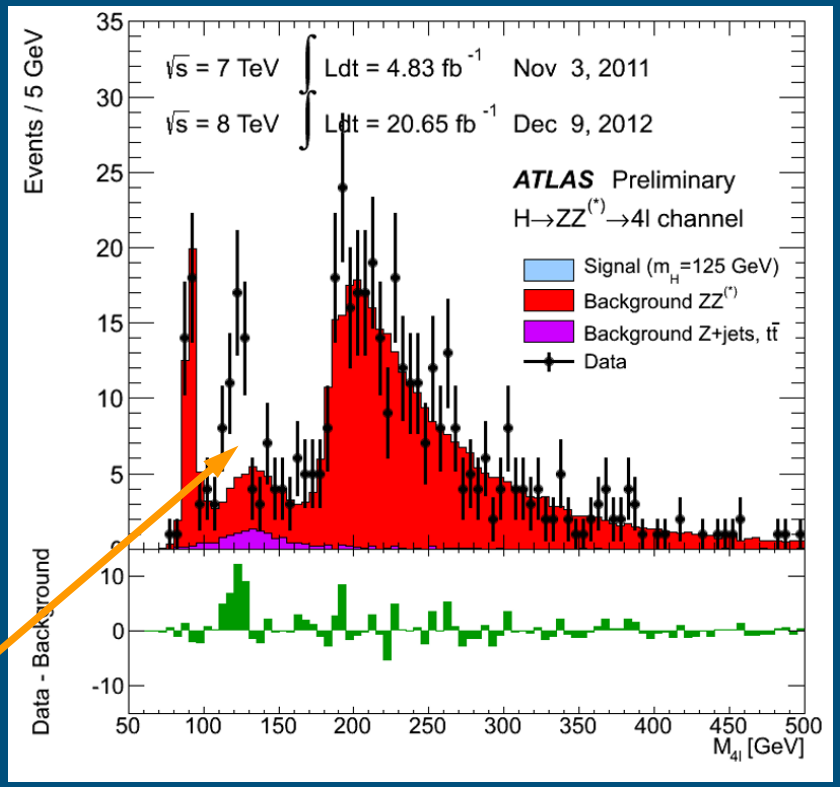
Higgs appears in 2011 - 2012

- Most fundamental role of Higgs is to stop matter particles from being obliged to move at speed of light on early Universe!



- ~1 - 5 Higgs per minute without us knowing!.... O(1 million) at production in total!
  - ATLAS+CMS: 1400 Higgs events after selection cuts
- Mass of the Higgs is equivalent to the total mass of 130 protons!

The Big Questions

Observations in Cosmology

- Event horizon problem
- Flatness
- Density variation which lead to star and galaxy formation
- Natural constants
- The missing antimatter
- The missing matter – Dark Matter
- Universe expansion rate is accelerating today – Dark Energy

Observations in particle physics

- Tiny neutrino mass and oscillations

Hints from particle physics theory

- Stability of Higgs mass
- Structure of matter and interactions
- Unification of interactions
- Why no CP violation in strong interaction
- Gravity

➔ Which extension to the Standard Model??

Prejudice…: "Universe is fine-tuned by chance or *driven* by obligation?"

The Big Questions

Observations in Cosmology

- Event horizon problem
- Flatness
- Density variation which lead to star and galaxy formation
- Natural constants
- The missing antimatter
- The missing matter – Dark Matter
- Universe expansion rate is accele

Observations in particle ph

- Tiny neutrin

Hints fr

- nteractions
- teractions
- CP violation in strong interaction
- Gravity

➔ Which extension to the Standard Model??

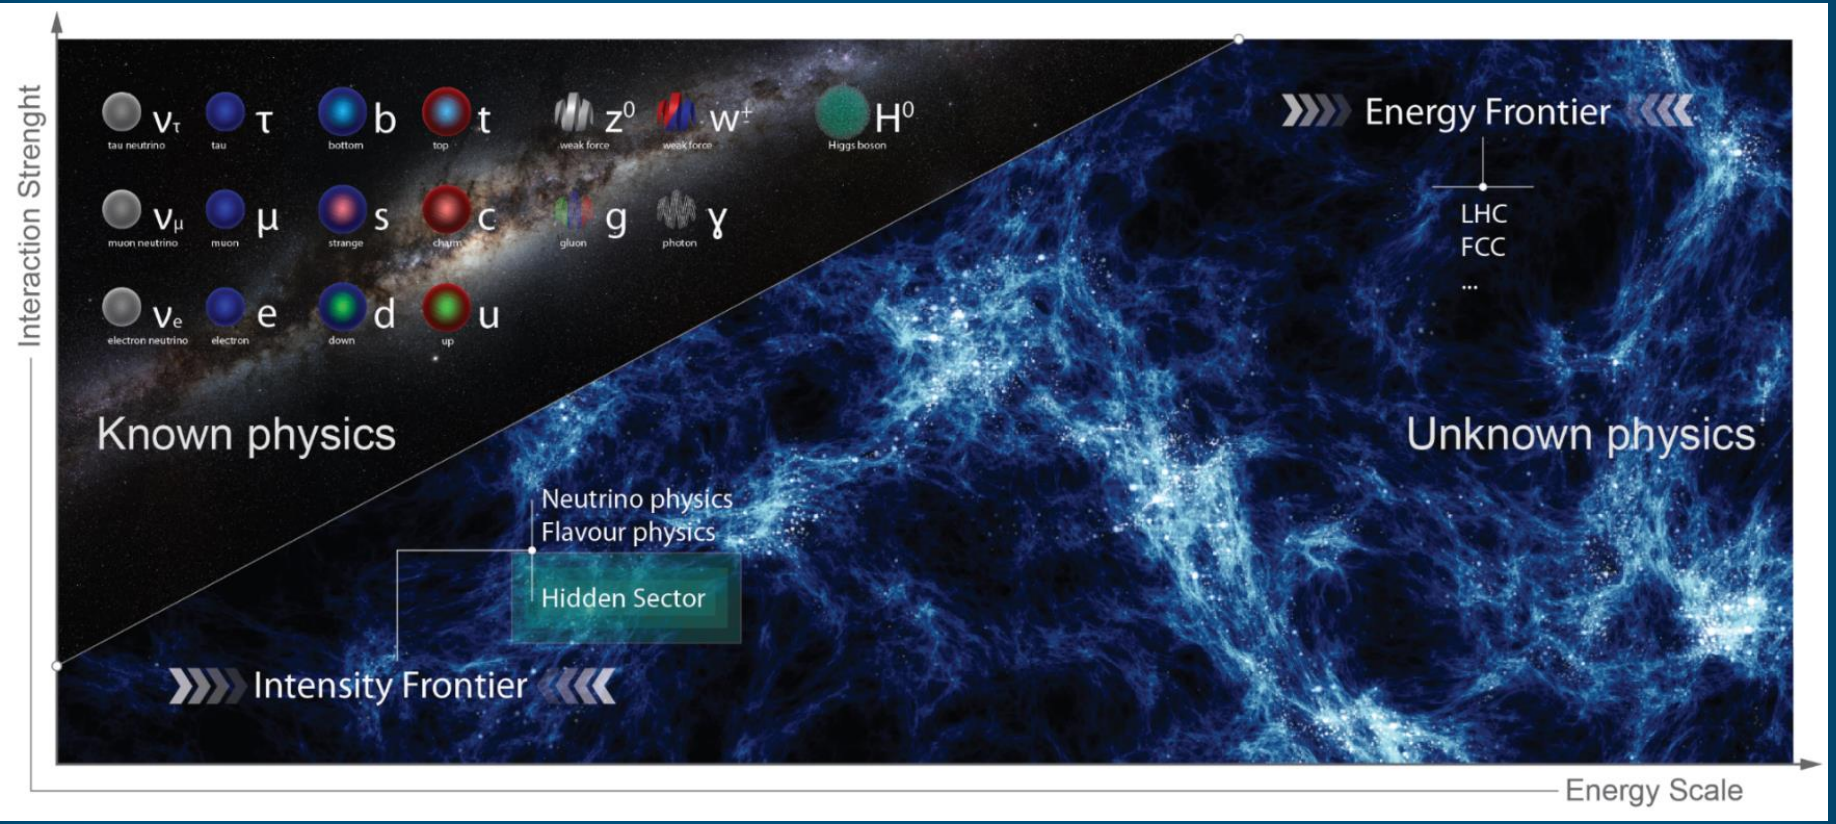
We need New Physics!
(i.e. new particles and interactions)

Prejudice…: "Universe is fine-tuned by chance or *driven* by obligation?"

Energy – intensity frontier

- What are the alternatives? "New particles" can hide in two ways:

Very massive OR very weakly coupled



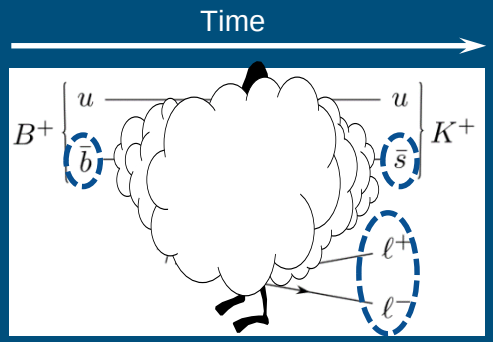
Precision measurements

Recipe:

- Choose processes which are rare and calculable to high precision in SM
  - Indirectly find evidence for New Physics as discrepancy from SM prediction!
  - Virtual effects allow probing energies much higher than the E_{cms} of the LHC

Example B meson decays to lepton pairs:

$$R_K = \frac{BR(B^+ \to K^+ e^+ e^-)}{BR(B^+ \to K^+ \mu^+ \mu^-)}$$



Precision measurements

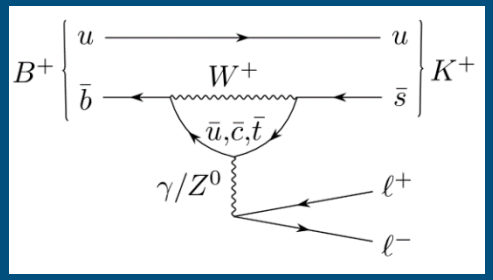
Recipe:

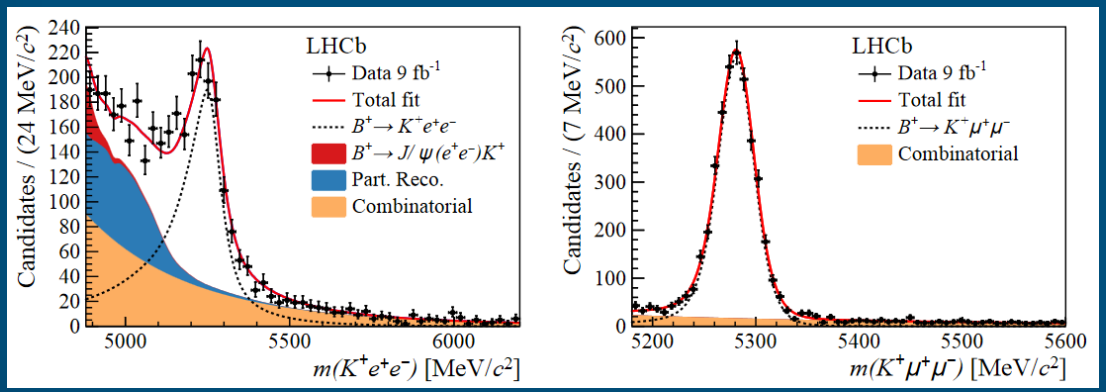
- Choose processes which are rare and calculable to high precision in SM
  - Indirectly find evidence for New Physics as discrepancy from SM prediction!
  - Virtual effects allow probing energies much higher than the E_{cms} of the LHC

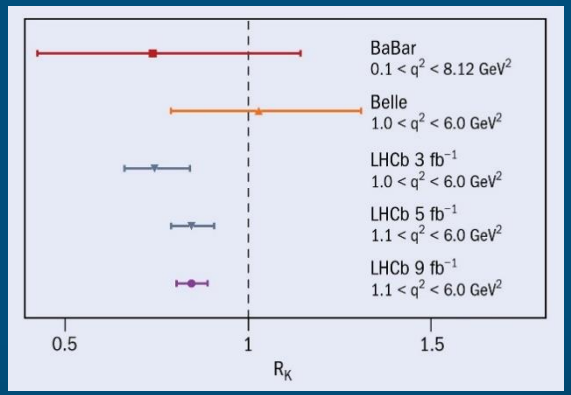
B meson decays to lepton pairs:

$$R_K = \frac{BR(B^+ \to K^+ e^+ e^-)}{BR(B^+ \to K^+ \mu^+ \mu^-)}$$

Lepton Universality (LU)
Expected to be ~unity in SM







Precision measurements

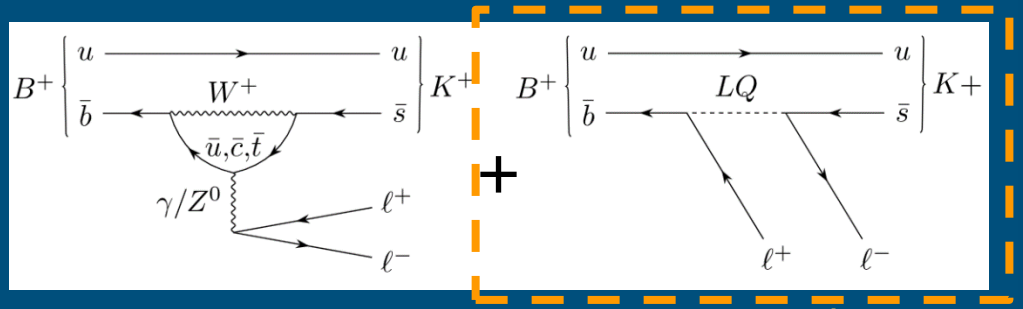
Recipe:

- Choose processes which are rare and calculable to high precision in SM
  - Indirectly find evidence for New Physics as discrepancy from SM prediction!
  - Virtual effects allow probing energies much higher than the E_{cms} of the LHC

B meson decays to lepton pairs:

$$R_K = \frac{BR(B^+ \to K^+ e^+ e^-)}{BR(B^+ \to K^+ \mu^+ \mu^-)}$$

E.g. lepto-quarks

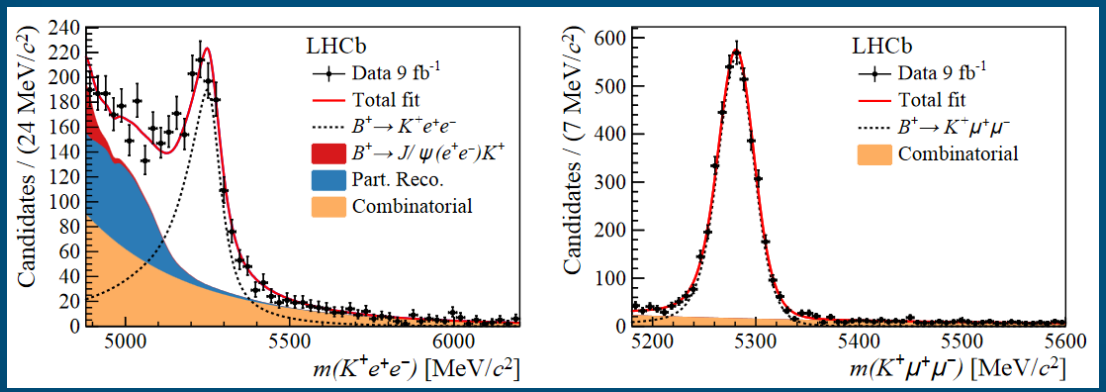


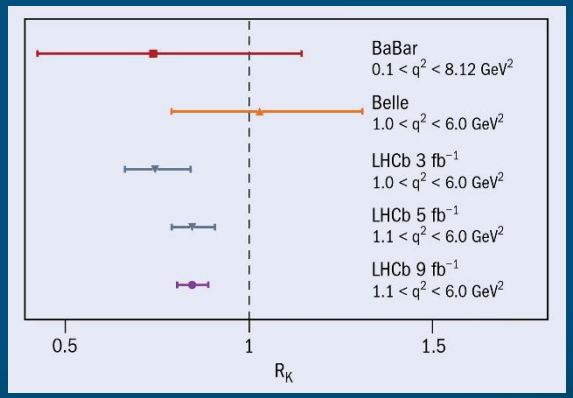
Lepton Universality Violation?

$$\text{“}R_K^{exp} = R_K^{SM} + R_K^{NewPhysics}\text{”}$$

R_K^{NP} contribution from New Physics

Analysis based on 1000 0000 0000 0000 measured b-decays!

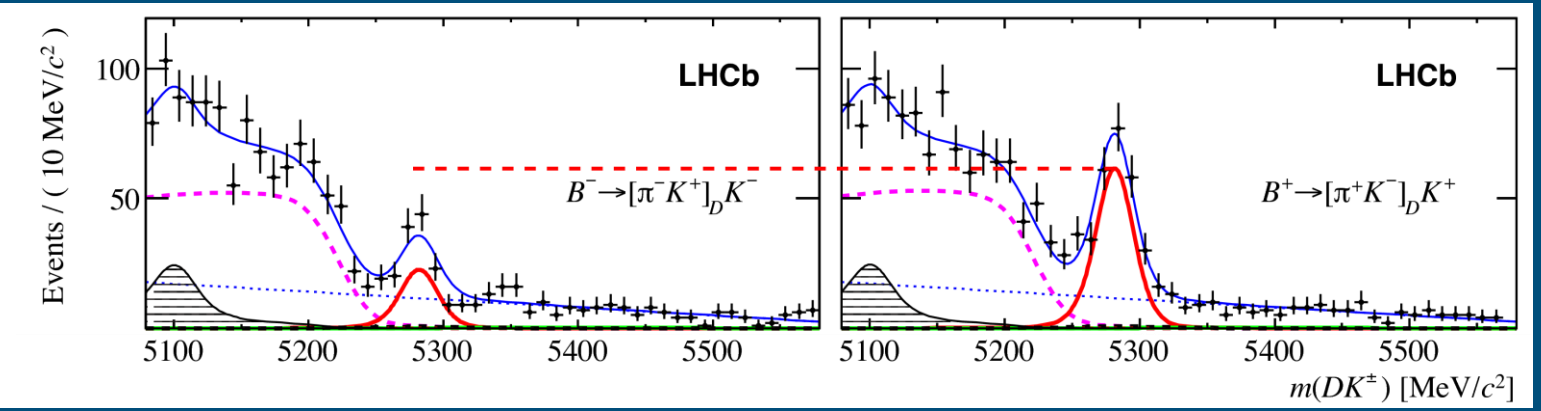




Example: missing anti-matter

- <u>"Baryon asymmetry" of the Universe</u>
  - Big Bang Nucleosynthesis and Cosmic Microwave Background $\eta = \left\langle \frac{n_B}{n_\gamma} \right\rangle_{T=3K} \sim 6 \times 10^{-10}$
  - ➔ How did this happen?!

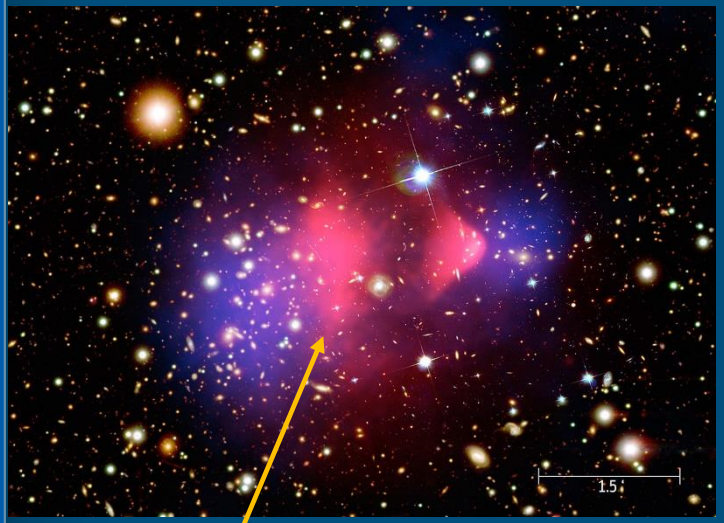
- "Manifestations" of CP violation: Matter-antimatter differs
  - Production rate
  - Decay rate
  - Mass
  - Lifetime
  - Current CP violation in quark sector ➔ $\eta \sim 10^{-20}$!!



Establishing Dark Matter – direct observation

- Tracing DM: Gravitational lensing confirms previous observations (2003)

Bullet galaxy clusters (2003)



https://arxiv.org/abs/astro-ph/0608407

Galaxy cluster Cl 0024+17 (ZwCl 0024+1652)
