# Probing Exotic Charged Higgs Decays in the Type-II 2HDM through Top Rich Signal at a Future 100 TeV pp Collider

Monday, 4 May 2020 17:45 (15 minutes)

The exotic decay modes of non-Standard Model (SM) Higgs bosons are efficient in probing the hierarchical Two Higgs Doublet Models (2HDM). In particular, the decay mode  $H^\pm \rightarrow HW^\pm$  serves as a powerful channel in searching for the charged Higgses. In our study, we analyzed the reach for  $H^\pm \rightarrow HW^\pm \rightarrow t\bar{t}W$  at a 100 TeV  $pp$  collider, and showed that it extends the reach of the previously studied  $\tau\tau W$  final states. Top tagging technique is used, in combination with the boosted decision tree classifier. Almost the entire hierarchical Type-II 2HDM parameter space can be probed via the combination of all exotic decay channels at low  $\tan\beta$  region.
