FROM THE INFRARED TO THE ULTRAVIOLET

Long-lived particle Searches at LHC

Xiao-Ping Wang
Argonne National Laboratory

Collaborated with Jia Liu, Zhen Liu and Lian-Tao Wang
May 4 2020

Why Long-lived Particles?

Why Long-lived Particles?

- Standard Model = fermions + force mediators

- Dark sector = DM + dark mediators

Standard Model of Elementary Particles

three generations of matter (fermions)			interactions / force carriers (bosons)	
	I	II	III	
mass	$\approx 2.2 \text{ MeV}/c^2$	$\approx 1.28 \text{ GeV}/c^2$	$\approx 173.1 \text{ GeV}/c^2$	0
charge	$\frac{2}{3}$	$\frac{2}{3}$	$\frac{2}{3}$	0
spin	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1
	u up	c charm	t top	g gluon
	$\approx 4.7 \text{ MeV}/c^2$	$\approx 96 \text{ MeV}/c^2$	$\approx 4.18 \text{ GeV}/c^2$	0
	$-\frac{1}{3}$	$-\frac{1}{3}$	$-\frac{1}{3}$	0
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1
	d down	s strange	b bottom	γ photon
	$\approx 0.511 \text{ MeV}/c^2$	$\approx 105.66 \text{ MeV}/c^2$	$\approx 1.7768 \text{ GeV}/c^2$	$\approx 91.19 \text{ GeV}/c^2$
	-1	-1	-1	0
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1
	e electron	μ muon	τ tau	Z Z boson
	$< 2.2 \text{ eV}/c^2$	$< 1.7 \text{ MeV}/c^2$	$< 15.5 \text{ MeV}/c^2$	$\approx 80.39 \text{ GeV}/c^2$
	0	0	0	± 1
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	W W boson

QUARKS (rows 1-3)
LEPTONS (rows 4-6)
GAUGE BOSONS VECTOR BOSONS (rows 7-8)
SCALAR BOSONS (row 9)

- Not a surprise: dark sector particles have a wide spread in lifetime

Why Looking for Long-lived Particle at LHC?

- LHC will accumulate more data
- Exp collaborations have broad physics programs: SUSY, composite H, extra Dim, etc.
- **New directions?**

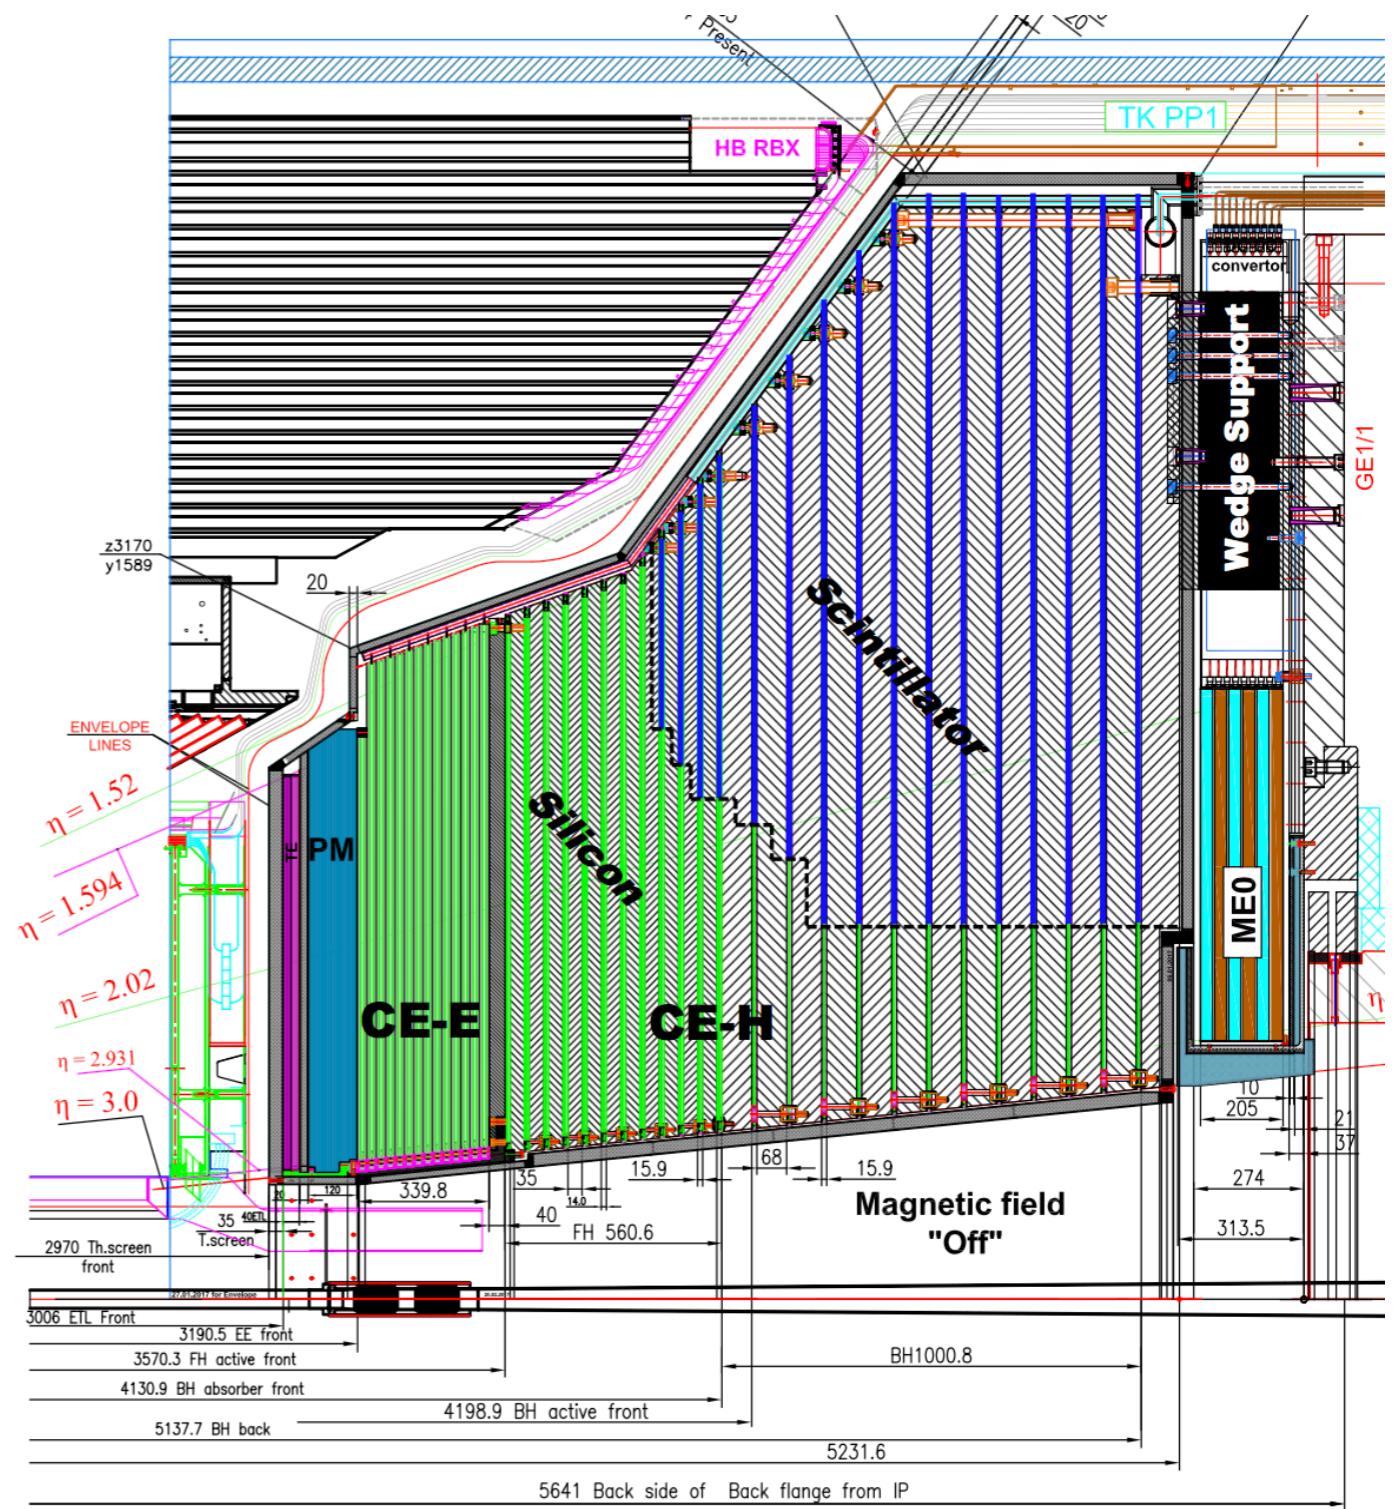

Why Looking for Long-lived Particle at LHC?

- Physics potential from a lot of new data
 - Very rare signal
 - E.g. dark sector, rare decays, ...
 - More data can help reducing systematics
 - Precision measurements

An important example:
Long-lived particles

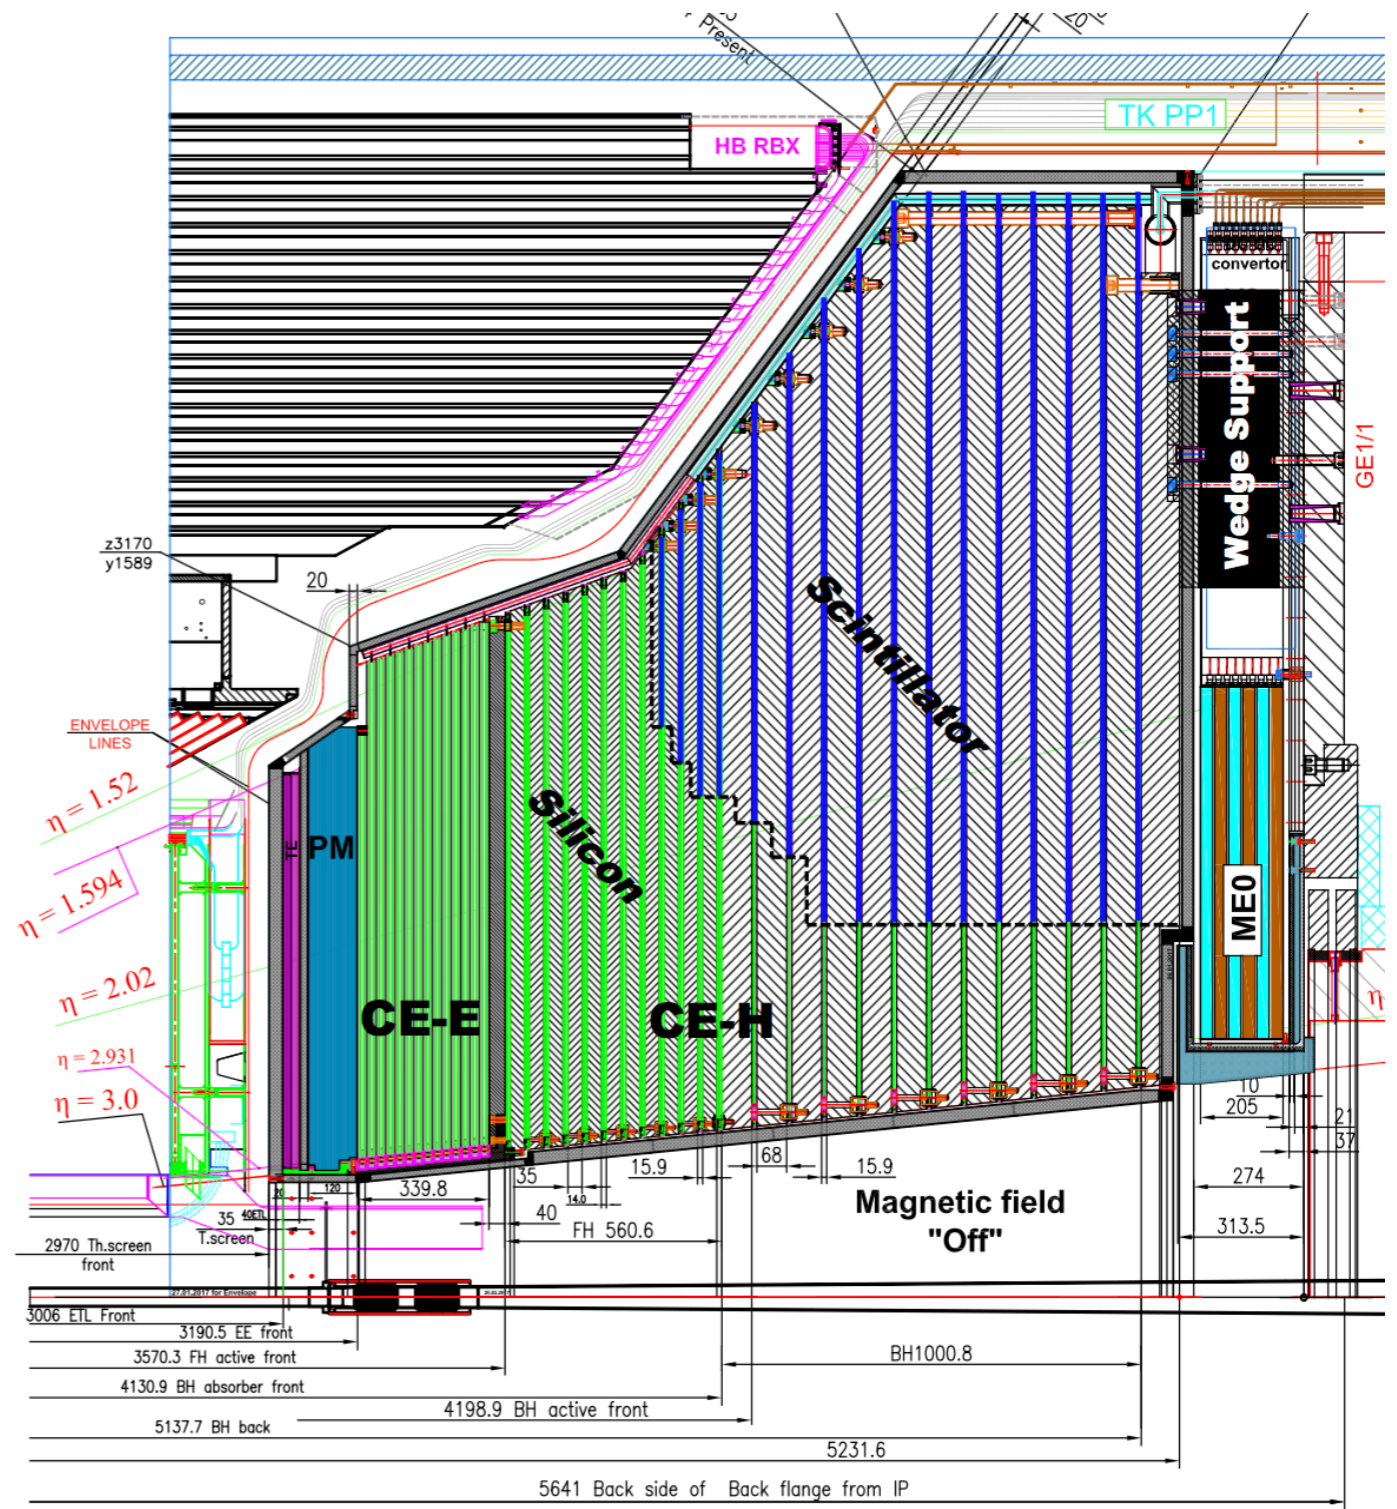

CMS High Granularity Calorimeter

- Motivation
 - Upgrade for radiation tolerance and pile-up
 - Tracker, calorimeter and timing integrated in one detector
 - Will provide much more information than any previous calorimeters

LLP motivation @ HGICAL

- Own triggers
- Tracker with silicon cell 0.5~1 cm² for EM
- Angular resolution of 5×10^{-3} rad stand-alone from high granularity (improvement by combining with ID trackers)
- Timing resolution ~ 25 ps from silicon sensor
- Semi-central coverage good for forward LLP
Collinear enhancement
Pt PS suppression

What is the HGICAL sensitivity for LLP?

LLP Model

- Higgs portal LLP: a very small mixing

$$\mathcal{L} \supset \lambda X^2 H^\dagger H$$

- LLP production from Higgs decay

- Gluon fusion
- Vector boson fusion

- LLP decay

$$X \rightarrow \bar{b}b$$

- Trigger: displaced track trigger with/without large H_T requirement, and traditional VBF trigger

The Search Strategy

- Choose the leading 5 tracks (Pythia, p_T , hitting HGCAL) and calculate the 4D trajectories (including angular resolution effect)
- Perform a 2D track bundle vertex finder by minimizing the quantity

$$\Delta D \equiv \sqrt{\sum_{i=1}^5 \left(\sqrt{(x - x_i^{\text{cen}})^2 + (y - y_i^{\text{cen}})^2} - R_i \right)^2}$$

- R_i is the curvature of the i th track, $\{x^{\text{cen}}, y^{\text{cen}}\}$ are the center of the track
- We obtain the fitted DV $\{x, y\}$, and define $r_{\text{DV}} = \sqrt{x^2 + y^2}$
- The goodness of fit ΔD_{min}
- With the angular velocity of the track, we can determine the referencing point to DV for each track $\{x_i, y_i, z_i, t_i\}$
- A time delay quantity can be defined $\Delta t_i = t_i - \sqrt{x_i^2 + y_i^2 + z_i^2}$

The signature of the signal

- Multiple tracks with large impact parameters from the same displaced origin

$B=3.8T$
X decay $|Z| < 1.5m$
Tracks arrive at $|Z|=3.2m$

The SM Backgrounds

- QCD backgrounds
- Most of them are prompt

- Large impact parameter dominantly from K_S ($c\tau \sim 2.7$ cm)
- B ($c\tau \sim 0.045$ m) and D meson ($c\tau \sim 0.03$ m) too small

The SM Backgrounds

- Fake track backgrounds
 - wrong connection of the hitting points in the tracker system

Flat distributions in

$$\phi_0, d_0^T, 1/R, z_0, t_0, \eta$$

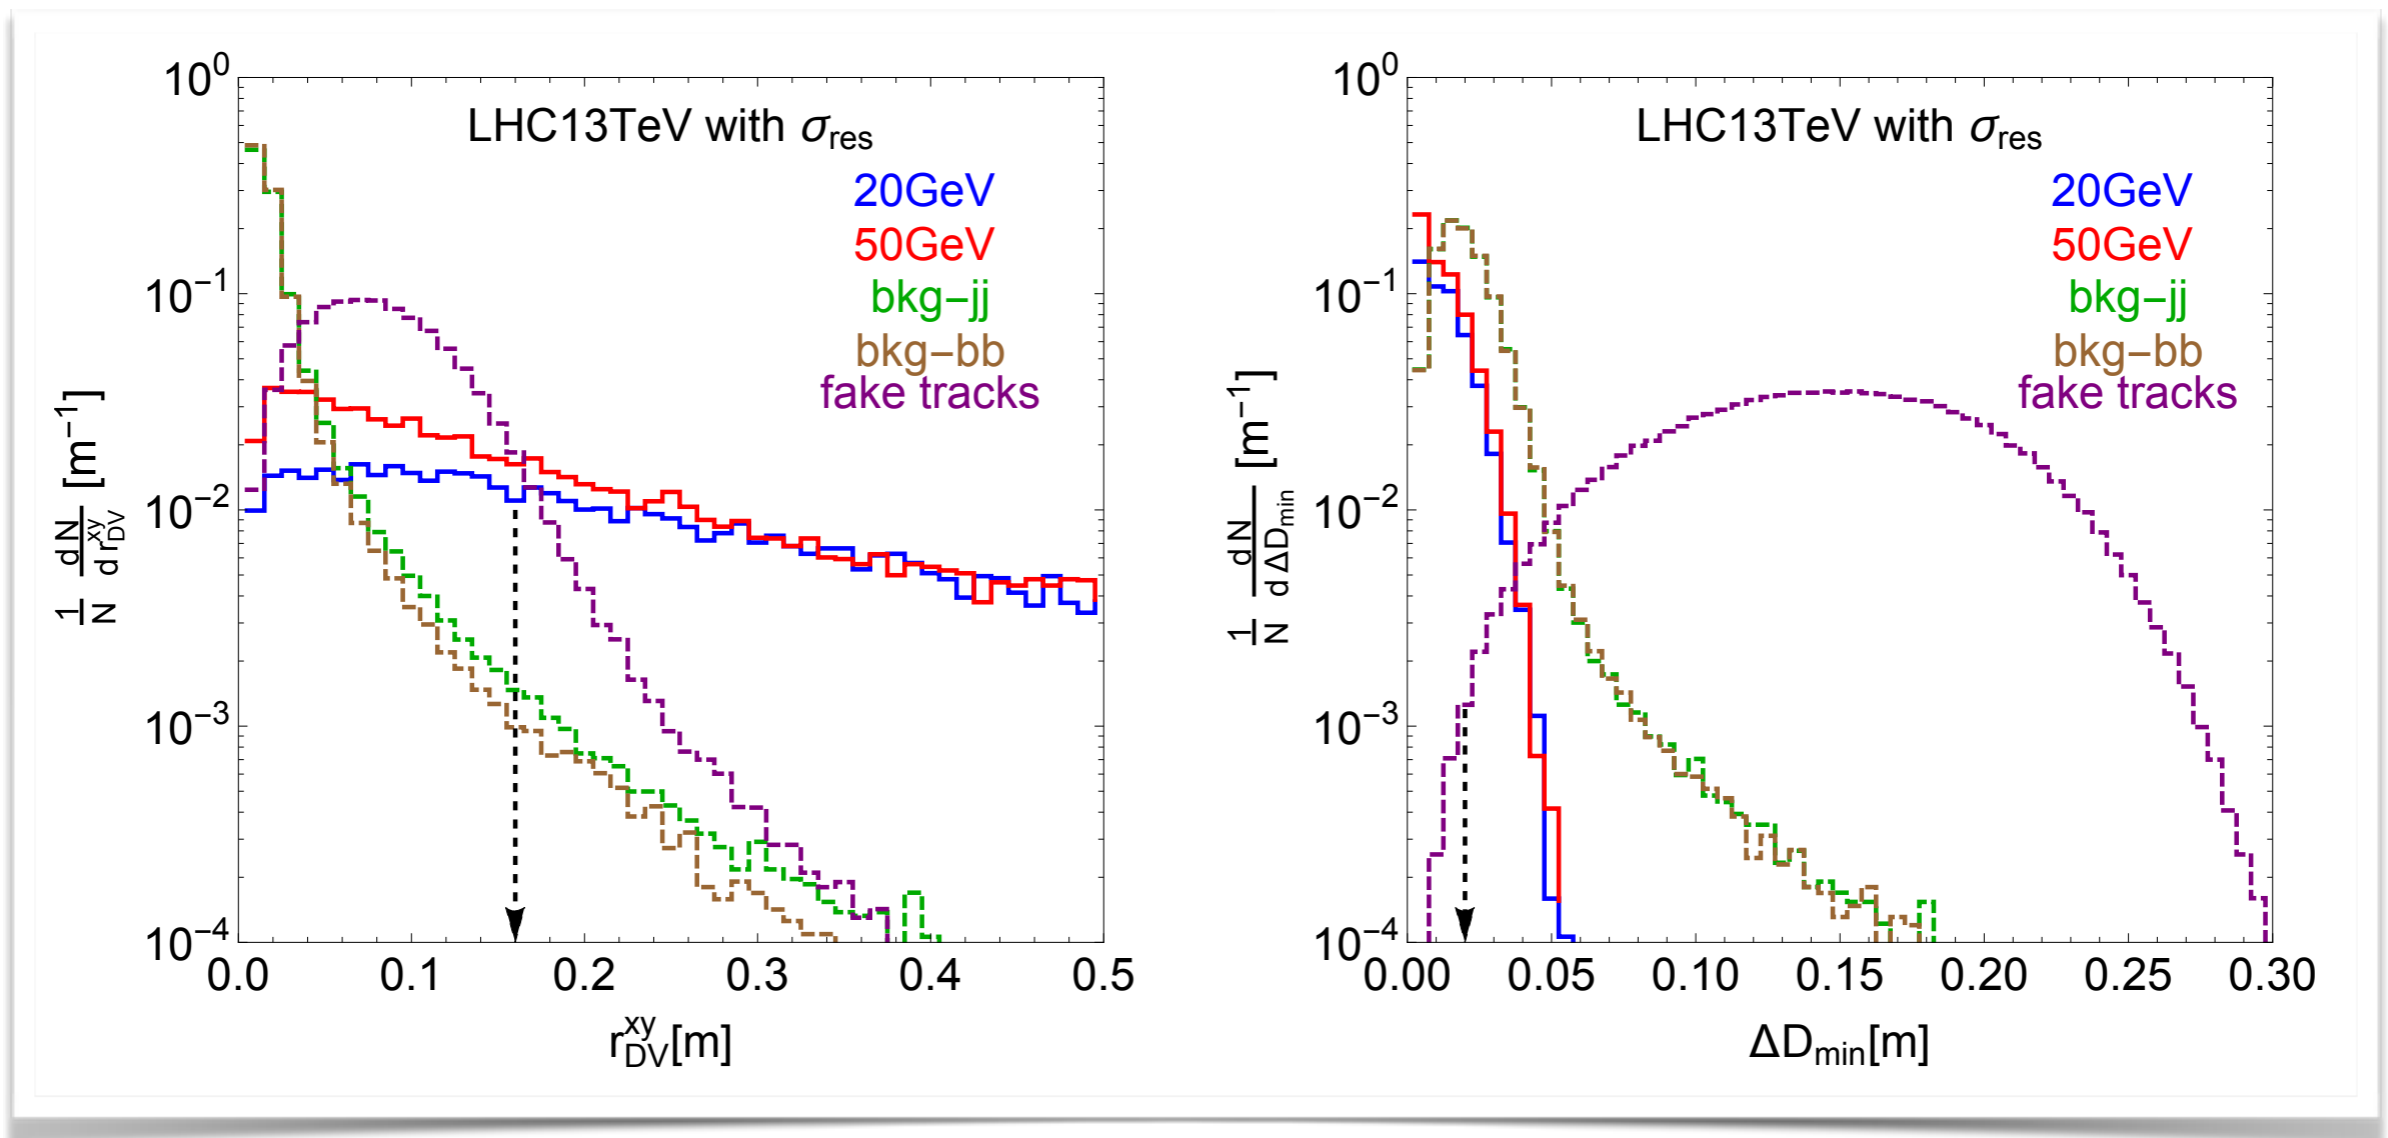

Generated following
Y. Gershtein and S. Knapen
1907.00007

- Very distinct features comparing with QCD backgrounds
 - Easy to have large impact parameter
 - Poorly fit to the same origin

Kinematic Features

- Check the kinematic distribution for

$$r_{DV}, \Delta D_{\min}, \bar{t}, \bar{z}, \overline{\Delta t}, SD_t, SD_z, SD_{\Delta t}.$$

Kinematic Features

- Check the kinematic distribution for

$$r_{DV}, \Delta D_{\min}, \bar{t}, \bar{z}, \overline{\Delta t}, SD_t, SD_z, SD_{\Delta t}.$$

- Standard Deviation of the tracks quantities

The Cut Flow Table

- QCD bkg: $p_T > 20 \text{ GeV}$ with jet matching
- Fake track bkg: five displaced tracks and $H_T > 100 \text{ GeV}$
L1 trigger rate of 10 kHz (same as Yuri and Simon), HL-LHC 10^8 sec

type of bkg	N_{ini}	5 tracks	$r_{\text{DV}}^{\text{xy}} > 0.16 \text{ m}$	$\Delta D_{\text{min}} < 0.02 \text{ m}$	$\bar{t} > 1 \text{ ns}$	$\text{SD}_t < 0.3 \text{ ns}$
jj dijet	5.1×10^{14}	9.4×10^{-1}	$1.0 \times 10^{-2} (*)$	8.7×10^{-1}	$3.0 \times 10^{-2} (*)$	7.3×10^{-1}
$b\bar{b}$ dijet	1.1×10^{13}	1.0	$7.7 \times 10^{-3} (*)$	9.2×10^{-1}	$2.4 \times 10^{-2} (*)$	7.4×10^{-1}

$b\bar{b}$ dijet	1.1×10^{13}	1.0	$7.7 \times 10^{-3} (*)$	9.2×10^{-1}	$2.4 \times 10^{-2} (*)$	7.4×10^{-1}	$2.7 \times 10^{-2} (*)$	4.9×10^{-1}	2.9×10^{-1}	$(6.5 \times 10^{-4})^5$	3.7×10^{-4}
fake track	1×10^{12}	5.6×10^{-1}	4.6×10^{-2}	2.2×10^{-3}	2.8×10^{-2}	6.2×10^{-5}	5.9×10^{-2}	5.4×10^{-3}	5.8×10^{-13}	3.4×10^{-1}	1.1×10^{-1}
ggF $m_s = 20 \text{ GeV}$	$1.3 \times 10^8 \text{BR}$	$0.36 \times 3.1 \times 10^{-1}$	5.3×10^{-1}	8.6×10^{-1}	9.9×10^{-1}	9.6×10^{-1}	9.8×10^{-1}	8.6×10^{-1}	1.2×10^{-1}	2.9×10^{-1}	$4.3 \times 10^6 \times \text{BR}$
ggF $m_s = 50 \text{ GeV}$	$1.3 \times 10^8 \text{BR}$	$0.8 \times 3.5 \times 10^{-1}$	3.5×10^{-1}	8.8×10^{-1}	9.8×10^{-1}	9.5×10^{-1}	8.9×10^{-1}	8.6×10^{-1}	9.0×10^{-2}	8.0×10^{-1}	$9.5 \times 10^6 \times \text{BR}$

- Fake track bkg suppressed because its random origin

Impact Parameter

$$d_0 = \sqrt{x^2 + y^2 - \frac{(xp_x + yp_y)^2}{p_x^2 + p_y^2}}$$

Kinematic Features

- Transverse impact parameters

- QCD bkg has a good Gaussian shape because pre-cuts excludes K_S meson decays
- Gaussian width comes from angular resolution
 $3 \text{ m} \times 5 \times 10^{-3} \text{ rad} = 0.015 \text{ m}$

Independence Check is Necessary

- QCD bkg: impact parameter cuts are independent?
 - Should be, because they are from angular resolution smearing

type of bkg	N_{ini}	5 tracks	$r_{\text{DV}}^{\text{xy}} > 0.16 \text{ m}$	$\Delta D_{\text{min}} < 0.02 \text{ m}$	$\bar{t} > 1 \text{ ns}$	$\text{SD}_t < 0.3 \text{ ns}$	$\bar{z} > 0.4 \text{ m}$	$\text{SD}_z < 0.05 \text{ m}$	ϵ_{vtc}	$(d_0^T > 0.03 \text{ m})^5$	N_{fin}

ggF $m_s = 20 \text{ GeV}$	$1.3 \times 10^8 \text{ BR}$	$0.36 \times 3.1 \times 10^{-1}$	5.3×10^{-1}	8.6×10^{-1}	9.9×10^{-1}	9.6×10^{-1}	9.8×10^{-1}	8.6×10^{-1}	1.2×10^{-1}	2.9×10^{-1}	$4.3 \times 10^6 \times \text{BR}$
ggF $m_s = 50 \text{ GeV}$	$1.3 \times 10^8 \text{ BR}$	$0.8 \times 3.5 \times 10^{-1}$	3.5×10^{-1}	8.8×10^{-1}	9.8×10^{-1}	9.5×10^{-1}	8.9×10^{-1}	8.6×10^{-1}	9.0×10^{-2}	8.0×10^{-1}	$9.5 \times 10^6 \times \text{BR}$

- Independence check

$$\text{IDd}_n \equiv \frac{\epsilon^n (1 \text{ track } d_0^T > 0.03\text{m})}{\epsilon(n \text{ tracks } d_0^T > 0.03\text{m})}$$

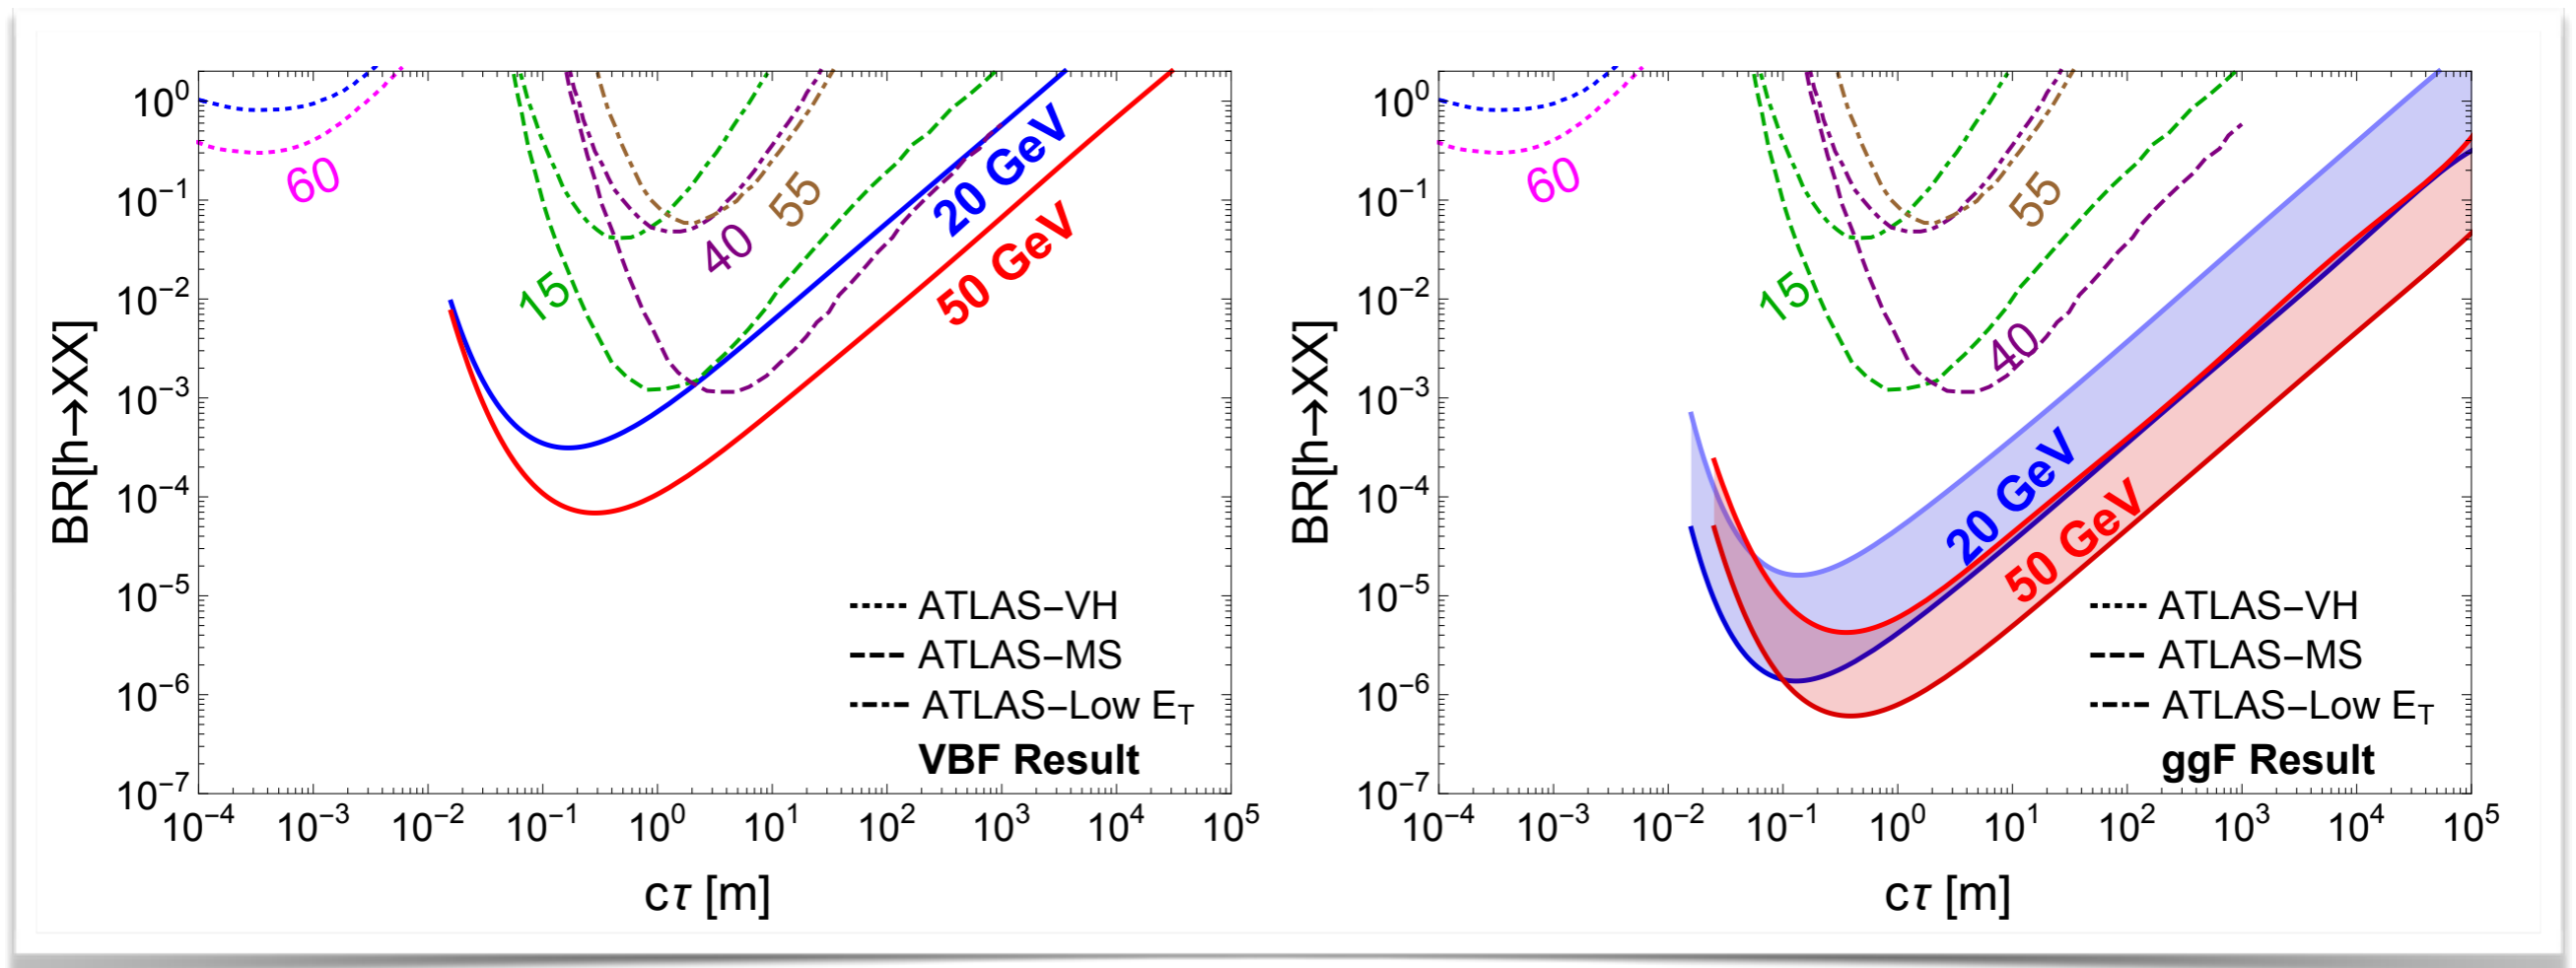

- ~ 1 independent, > 1 conservative
- In summary, ≥ 1 is conservative for bkg estimation

Independence Check

- QCD bkg: impact parameter for tracks are independent
- angular resolution smearing is independent for each track

<i>jj</i> dijets	$d_0^T > 0.01$ m	$d_0^T > 0.015$ m	$d_0^T > 0.02$ m	$d_0^T > 0.025$ m	$d_0^T > 0.03$ m
