# Motivation

## W and Z production at the LHC

Standard Model Total Production Cross Section Measurements Status: November 2019

- Big cross section and clean experimental signature.
- W boson mass and  $\sin^2\theta_{eff}^l$  determination.
- New physics search, eg.  $W'$  and  $Z'$  resonances.
- Constraining PDF, detector calibration and determination of collider luminosity.

## Motivation

### Mixed QCD-EW correction enhancement at higher energy

$$\sigma_{\text{QCD+wk}} = \sigma_{(N)\text{NLOQCD}} + \sigma_{\text{wk}}$$

$$\delta_{\text{add}} = \frac{\sigma_{\text{QCD+wk}} - \sigma_{(N)\text{NLOQCD}}}{\sigma_{(N)\text{NLOQCD}}} = \frac{\sigma_{\text{wk}}}{\sigma_{(N)\text{NLOQCD}}}$$

$$\sigma_{\text{QCD}\times\text{wk}} = \sigma_{(N)\text{NLOQCD}} \left( 1 + \frac{\sigma_{\text{wk}}}{\sigma_{\text{LO}}} \right)$$

$$\delta_{\text{prod}} = \frac{\sigma_{\text{QCD}\times\text{wk}} - \sigma_{(N)\text{NLOQCD}}}{\sigma_{(N)\text{NLOQCD}}} = \frac{\sigma_{\text{wk}}}{\sigma_{\text{LO}}}$$

[Campbell, Wackerroth, Zhou ,2016]

# Mixed QCD-EW Corrections

## Mixed QCD-EW corrections

# Structure of the fixed order prediction

$$d\sigma = d\sigma_{LO} + \alpha d\sigma_{\alpha} + \alpha^2 d\sigma_{\alpha^2} + \dots + \alpha_s d\sigma_{\alpha_s} + \alpha_s^2 d\sigma_{\alpha_s^2} + \dots + \alpha\alpha_s d\sigma_{\alpha\alpha_s} + \alpha\alpha_s^2 d\sigma_{\alpha\alpha_s^2} + \dots$$

(a) Double-virtual corrections

(b) Real QCD  $\times$  virtual EW corrections

(c) Virtual QCD  $\times$  real photonic corrections

(d) Double-real corrections

[Alexander Huss '14]

## Mixed QCD-EW corrections

# Structure of the fixed order prediction

$$d\sigma = d\sigma_{LO} + \alpha d\sigma_{\alpha} + \alpha^2 d\sigma_{\alpha^2} + \dots + \alpha_s d\sigma_{\alpha_s} + \alpha_s^2 d\sigma_{\alpha_s^2} + \dots + \alpha\alpha_s d\sigma_{\alpha\alpha_s} + \alpha\alpha_s^2 d\sigma_{\alpha\alpha_s^2} + \dots$$

(a) Double-virtual corrections

(b) Real QCD × virtual EW corrections

(c) Virtual QCD × real photonic corrections

(d) Double-real corrections

[Alexander Huss '14]

## Mixed QCD-EW corrections

# Born interfered double virtual corrections at $O(\alpha\alpha_s)$

(a) Factorizable “initial–initial” corrections

(b) Factorizable “final–final” corrections

(c) Factorizable “initial–final” corrections

(d) Non-factorizable corrections

[Alexander Huss '14]

## Mixed QCD-EW corrections

### Born interfered double virtual corrections at $O(\alpha\alpha_s)$

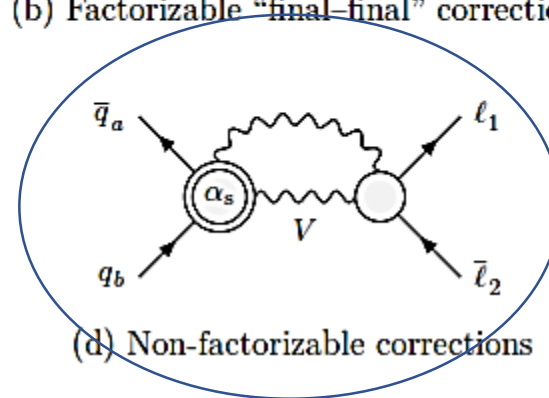

(a) Factorizable “initial–initial” corrections

(b) Factorizable “final–final” corrections

(c) Factorizable “initial–final” corrections

(d) Non-factorizable corrections

[Alexander Huss '14]

## Mixed QCD-EW corrections

Example Feynman diagrams for non factorizable double virtual correction at  $\mathcal{O}(\alpha\alpha_s)$  to DY process

-> All the ingredients, i.e. Master Integrals, for the process  $q\bar{q} \rightarrow l^+l^-$  and  $q\bar{q}' \rightarrow l\bar{\nu}$  are calculated in the massless final state approximation.

[Bonciani, Di Vita, Mastrolia, Schubert, 2016]  
[Manteuffel, Schabinger, 2017]  
[Heller, Manteuffel, Schabinger, 2019]

## Mixed QCD-EW corrections

detector effects require control over the inclusiveness

-> It is necessary to keep lepton mass up to logarithmic term

[Baur, Keller, Sakumoto, 1997]

## Mixed QCD-EW corrections

MIs for the NC DY process in case of single massive gauge boson exchange

# Method

-> Amplitude given by Feynman diagrams

$$A = \sum_i a_i I_i$$

-> Amplitude given by Feynman diagrams

$$A = \sum_i a_i I_i$$

-> Project onto basis using Integration by Parts identities

(Tkachov; Chetyrkin, Tkachov)

$$A = \sum_i c_i f_i$$

**Implemented in public codes**

REDUZE (Studerus, von Manteuffel)

Fire (Smirnov)

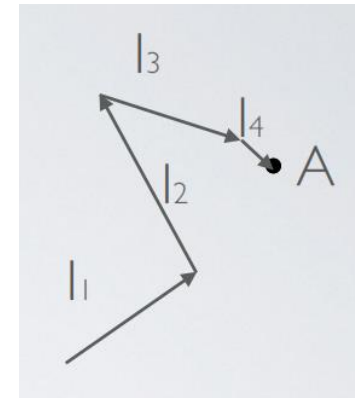

Air (Anastasiou, Lazopolus)

Kira (Maierhoefer, Usovitsch, Uwer)

-> Amplitude given by Feynman diagrams

$$A = \sum_i a_i I_i$$

-> Project onto basis using Integration by Parts identities

(Tkachov; Chetyrkin, Tkachov)

$$A = \sum_i c_i f_i$$

Implemented in public codes

REDUZE (Studerus, von Manteuffel)

Fire (Smirnov)

Air (Anastasiou, Lazopolus)

Kira (Maierhoefer, Usovitsch, Uwer)

-> Calculate basis elements via differential equations

# Differential Equation

-> Kinematic derivative in space spanned by MIs

$$\partial_x \bar{f} = A_x \bar{f}$$

# Differential Equation

-> Kinematic derivative in space spanned by MIs

$$\partial_x \bar{f} = A_x \bar{f}$$

-> Conjecture: There is a basis such that:

$$\partial_x \bar{g} = \epsilon \tilde{A}_x \bar{g} \quad (\text{Henn})$$

-> There are many strategies to get the epsilon factorized form

- Magnus Theorem (Ageri, Di Vita, Mastrolia, Mirabella, Schlenk, Tancredi, US)
- Unit leading Singularity (Henn)
- Reduction to fuchsian form and Eigenvalue normalization (Lee, Smirnov)
- Factorization of Picard-Fuchs operator (Adams, Chaubey, Weinzierl)

# Solving Canonical Differential Equation

## Canonical form

$$\partial_x \vec{g}(x, \epsilon) = \epsilon \tilde{A}_x(x) \vec{g}(x, \epsilon)$$

$$d\vec{g}(x, \epsilon) = \epsilon \sum_i M_i d\log(\eta_i) \vec{g}(x, \epsilon)$$

- Kinematic dependence encoded in  $\eta$
- $\eta$ 's form the alphabet

## Solution given by

$$\vec{g}(x, \epsilon) = \left[ 1 + \sum_{i=1}^{\infty} \int_{\gamma} dA \dots dA \right] \vec{g}(x_0, \epsilon)$$

**Algebraic  $\eta$ s** : Chen Iterated Integrals (Chen)

$$C(\vec{\eta}_n; x) = \int_{\gamma} d\log(\eta_1) \dots d\log(\eta_n)$$

**Rational  $\eta$ s** : Generalized Polylogarithms

(Goncharov)

$$G(\vec{0}_n; x) = \frac{1}{n!} \text{Log}(x)^n$$

$$G(\vec{w}_n; x) = \int_0^x \frac{dt}{t - w_1} G(\vec{w}_{n-1}; t)$$

# Boundary Conditions

-> Solution given by

$$\vec{g}(x, \epsilon) = \left[ 1 + \sum_{i=1}^{\infty} \int_{\gamma} dA \dots dA \right] \vec{g}(x_0, \epsilon)$$

-> Two general ways to fix the boundary

## Known Limit

- Taking the limit  $x$  to  $x_0$
- Fix boundary constant by matching the solution to known function

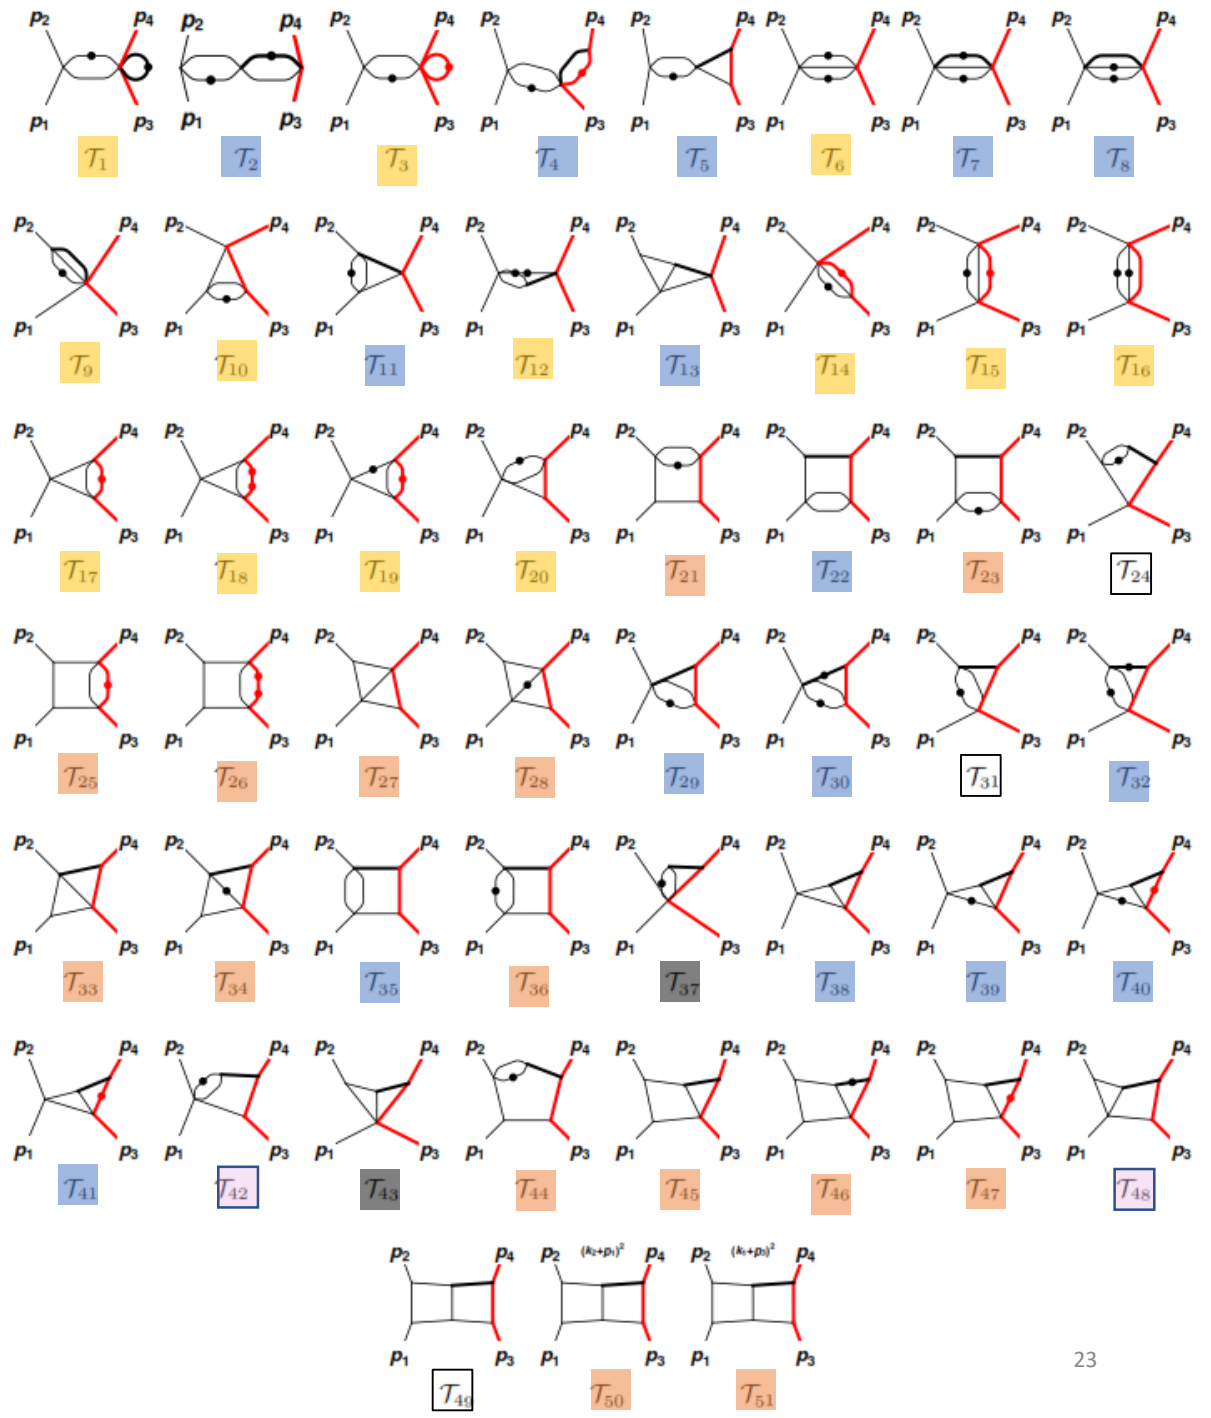

## Pseudo-thresholds

- Solution has unphysical divergences
- Demanding absence of unphysical divergences gives relations between boundary constant
- Leftover constants must be provided

# Method

## Boundary Fixing:

- input
- $m_l^2 \rightarrow 0$
- $s \rightarrow 0$
- $s \rightarrow -t$
- $t \rightarrow -m_z^2$
- $t \rightarrow -\frac{m_z^2 s}{m_z^2 - s}$

# Outlook

- The newly calculated master integrals can be of interest to study the logarithmic structure of the lepton mass in the amplitude.
- With our available ingredients, the amplitude can be written in terms of GPLs which is easy to incorporate into Monte Carlo to simulate differential distributions.

- Thank You

### Available fixed order calculations for W and Z production

- NLO QED and QCD corrections. (known for a long time)
- NLO EW corrections. [Wackerroth et al '97,'98,'04],[Baur et al '98,'02,'04],[Dittmaier et al '02,'10]
- NNLO QCD and QED corrections [Hamberg et al '91],[Anastasiou et al '03,'04],[Melnikov,Petriello '06],[Stefano et al '07]
- NNLO Mixed QCD-EW corrections to decay of W & Z boson. [Kuhn et al '96],[Kara '13]
- NNLO Mixed QCD-EW corrections to Z production form factors [Kotikov et al '08]
- NNLO QCD-QED virtual corrections to lepton pair production. [Kilgore et al '12]
- NNLO Mixed QCD-EW virtual corrections to DY production of W and Z bosons [Bonciani '11]
- Double real contribution to total cross section for on-shell single gauge boson production. [Bonciani et al 2016]
- NNLO Mixed QCD-EW corrections adopting pole approximation. [Dittmaier, Huss, Schwinn '14,'16]
- QCD×QED [ $O(\alpha\alpha_s)$ ] mixed and QED2 [ $O(\alpha^2)$ ] corrections to the production of an on-shell Z boson [Florian, Ignacio 2018]
- NNLO QCD×EW corrections to Z production in the  $q\bar{q}$  channel [Bonciani et al '2019]
- **To do : Complete NNLO Mixed QCD-EW corrections for W and Z production in a fully flexible Monte Carlo program.**

# ATLAS Report on W mass (January 2017)

Currently at the LHC  $M_W$  is extracted from  $M_T$  and  $P_T$  of the  $l\nu$  in W boson production.

$$m_W = 80370 \pm 7 \text{ (stat.)} \pm 11 \text{ (exp. syst.)} \pm 14 \text{ (mod. syst.) MeV}$$

$$= 80370 \pm 19 \text{ MeV,}$$
