## Sorting the magnets in the machine: what did/will we gain ?

*Tuesday 24 January 2006 16:20 (15 minutes)*

The criteria for sorting the magnets in the machine are outlined, pointing out which are the most critical and the expected gain in terms of machine performances. The compatibility of the sorting with planning issues experienced in the past year is reviewed. The expected difference or similarity between the sectors is analysed, and the representativity of the first sector that will be tested with respect to the whole machine is discussed.
