Safety - a Reminder in Time of Intense Co-activities

Wednesday 25 January 2006 14:25 (20 minutes)

In view of the very tight schedule of the LHC project many installation activities will progress in parallel in the tunnel at many work sites. The presentation will give an overview of and recall the most important security aspects that have to be taken into account by the different project engineers responsible for equipment being installed. The LHC project engineers have the responsibility to ensure that a tight schedule does not have a negative impact on the safety of the activities for which they are responsible. The LHC project Safety co-ordination team is always available to help the project engineers to mitigate the inherent risks of a multi-activity worksite.
