

# **N\* Transition Form Factors with CLAS at Jefferson Lab**

**Kyungseon Joo**

**University of Connecticut**

**For the CLAS Collaboration**

**DIS 2010**

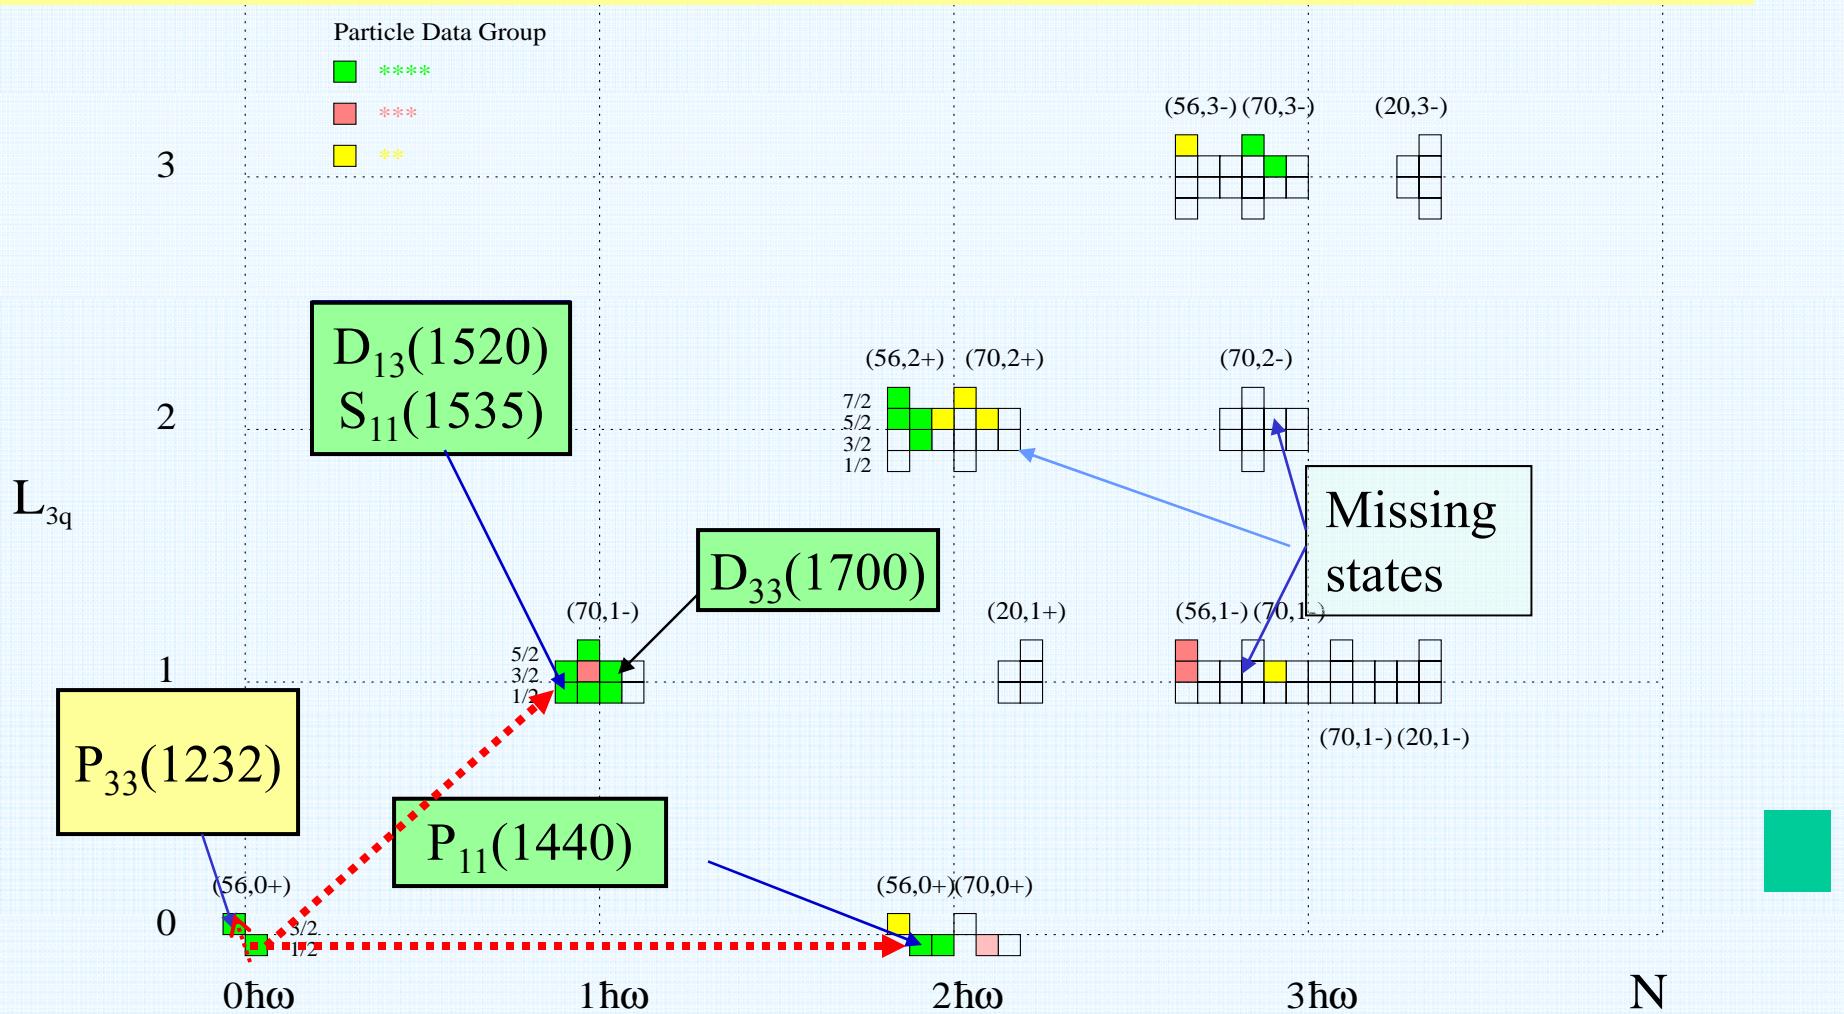

**Florence, Italy**

**April 20, 2010**

# The N\* spectrum and its Classification

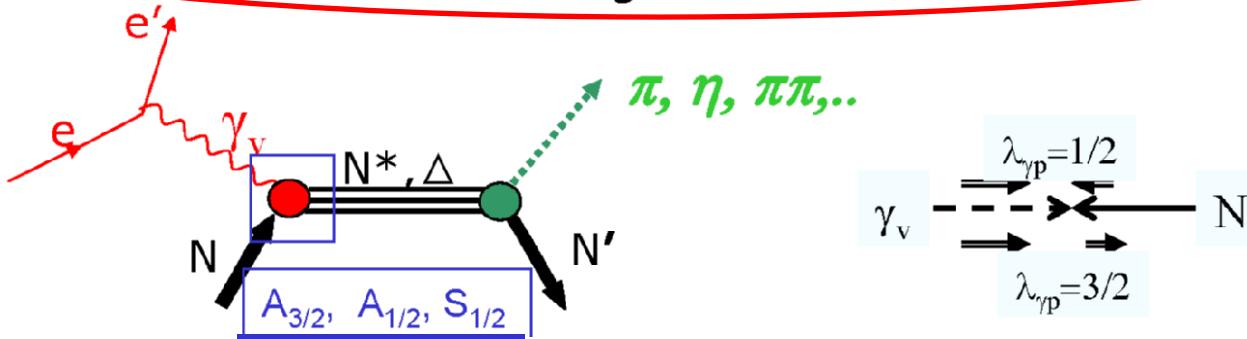

Observed spectrum with supermultiplets → degrees of freedom  
→ 3 quarks with  $SU(6) \times O(3)$  symmetric interactions

# Electromagnetic Excitation of N\*’s

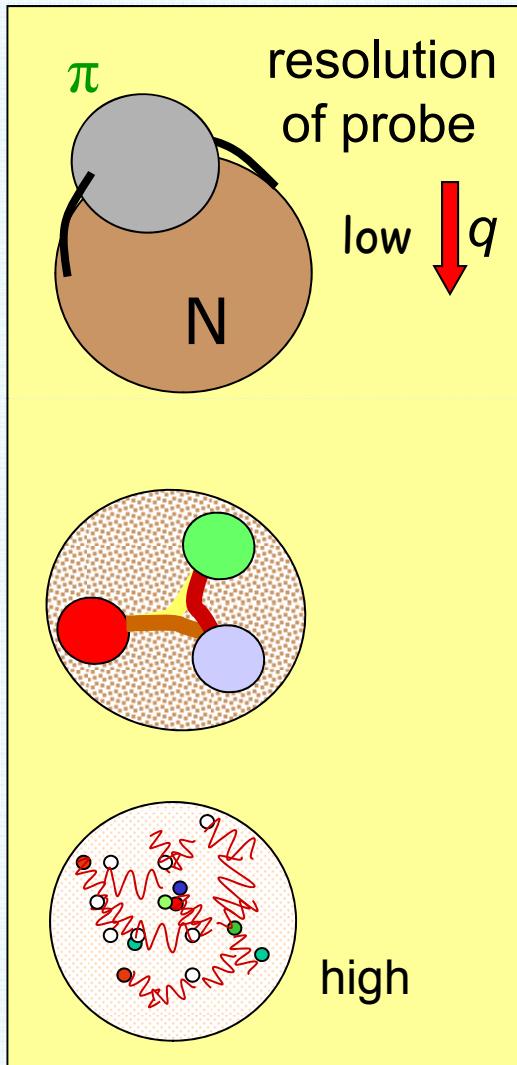

The experimental N\* Program has two major components:

- 1) Accurate measurements of transition form factors ( $A_{3/2}$ ,  $A_{1/2}$ ,  $S_{1/2}$ ) of known states as photon virtuality ( $Q^2$ ) to probe their internal structure and confining mechanism

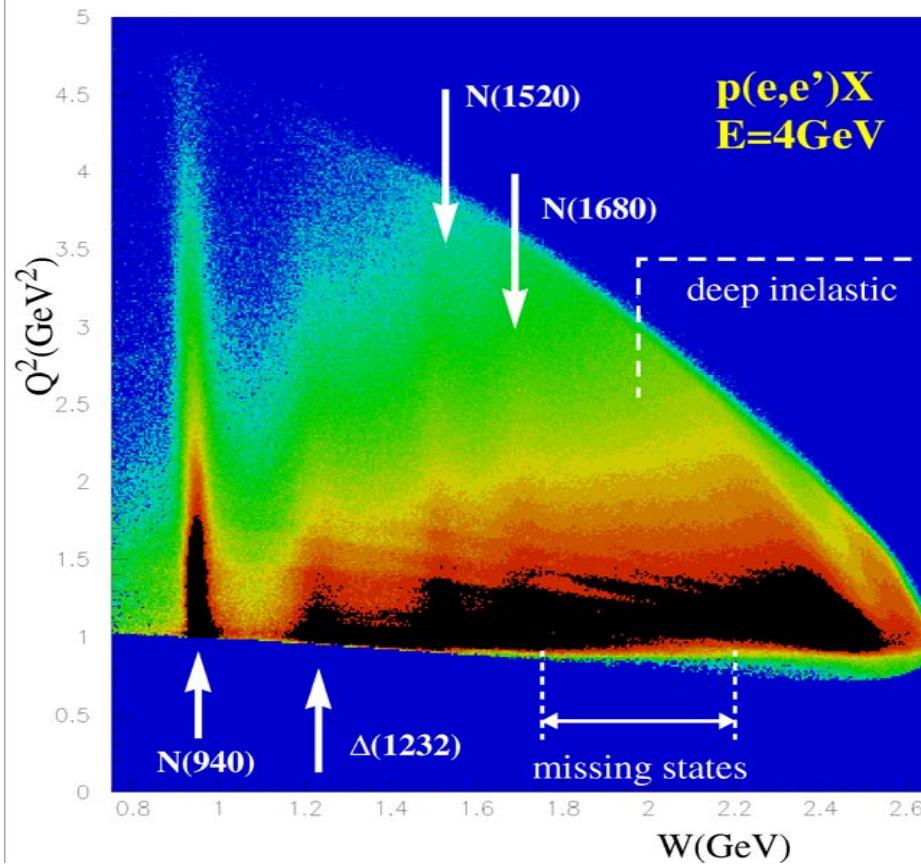

- 2) Search for undiscovered new baryon states.

# Electromagnetic Excitation of N\*

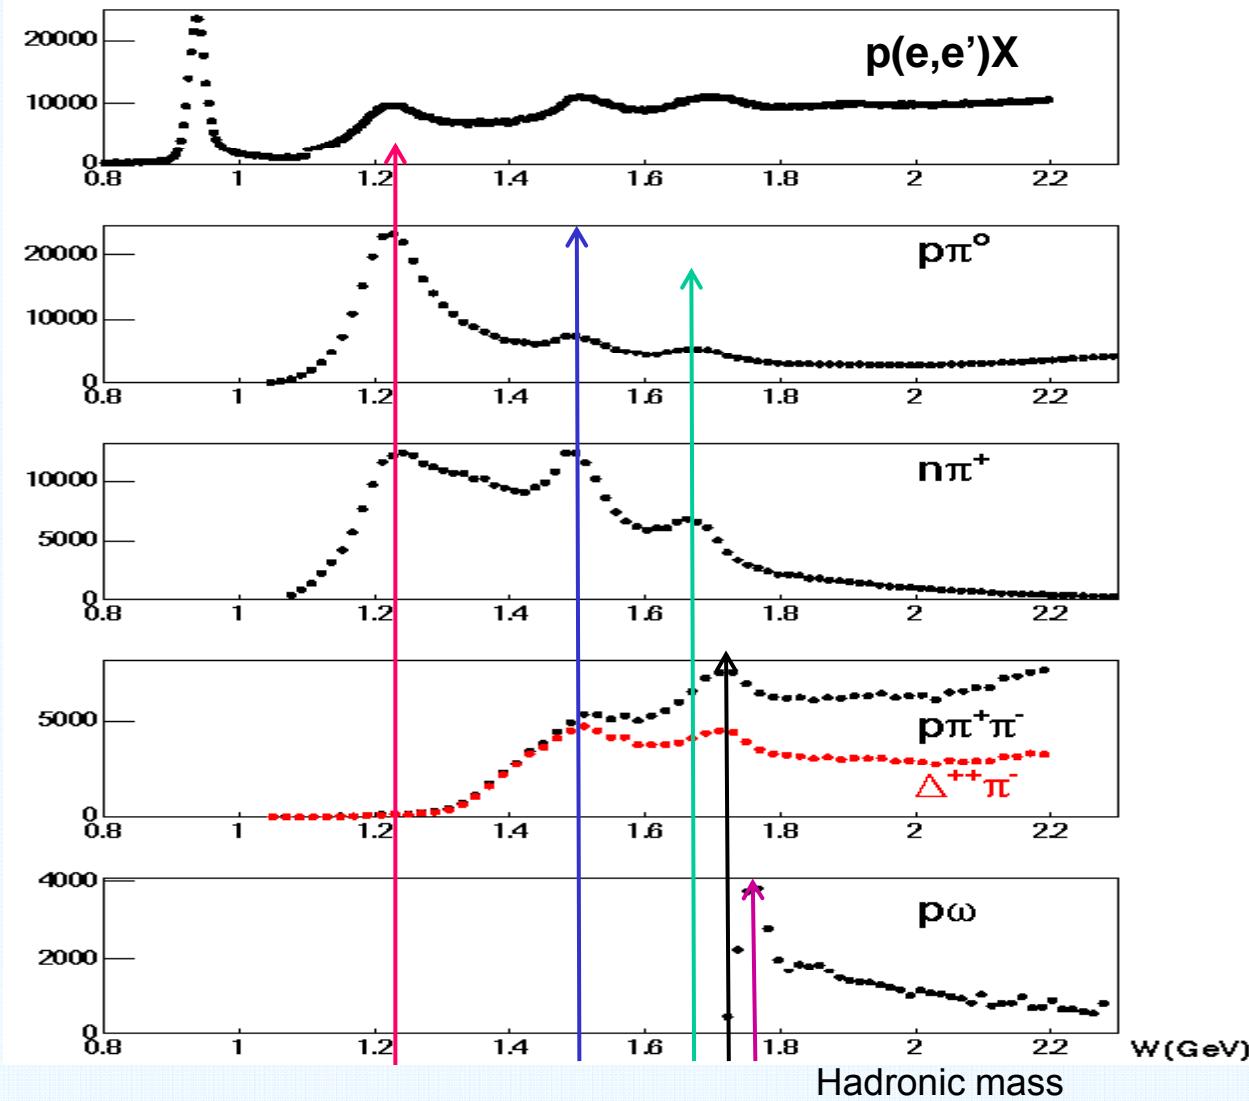

- Allows to address the central question:  
What are the relevant degrees-of-freedom  
at varying distance scale?

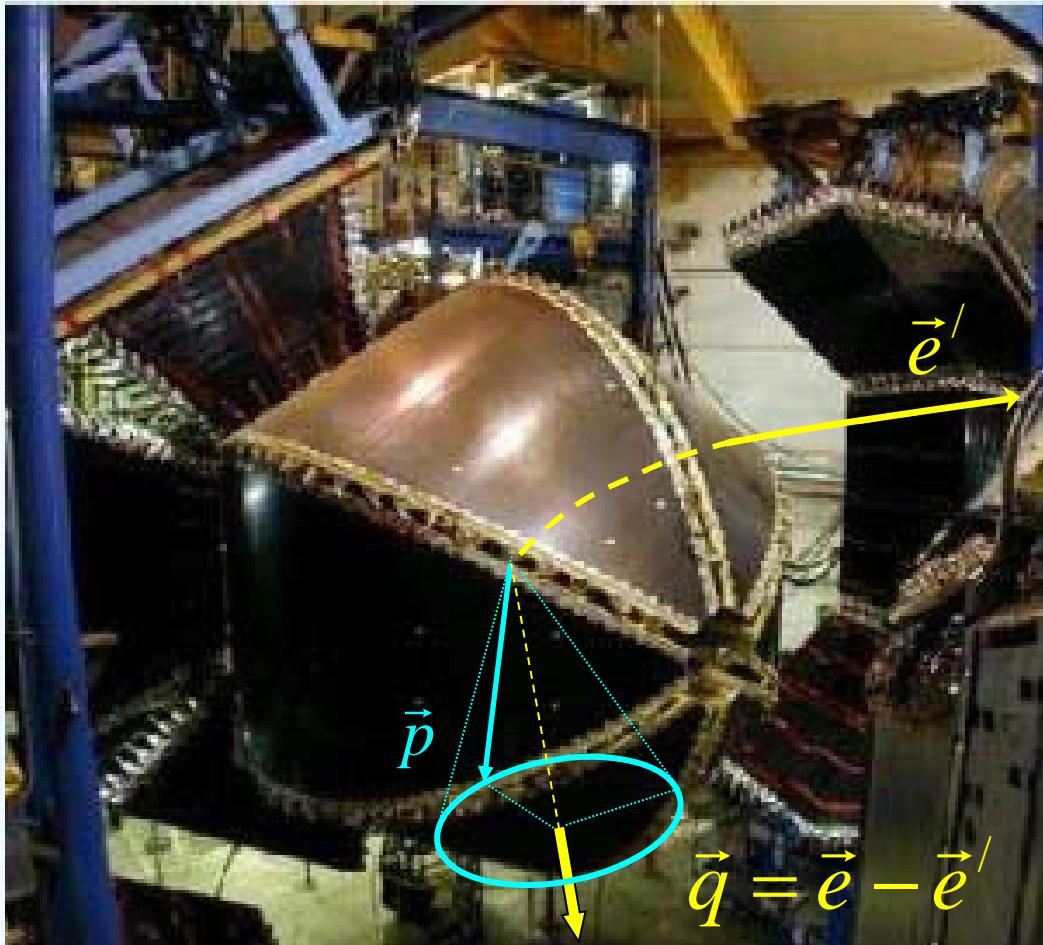

# Electromagnetic Excitation of N<sup>\*</sup>'s

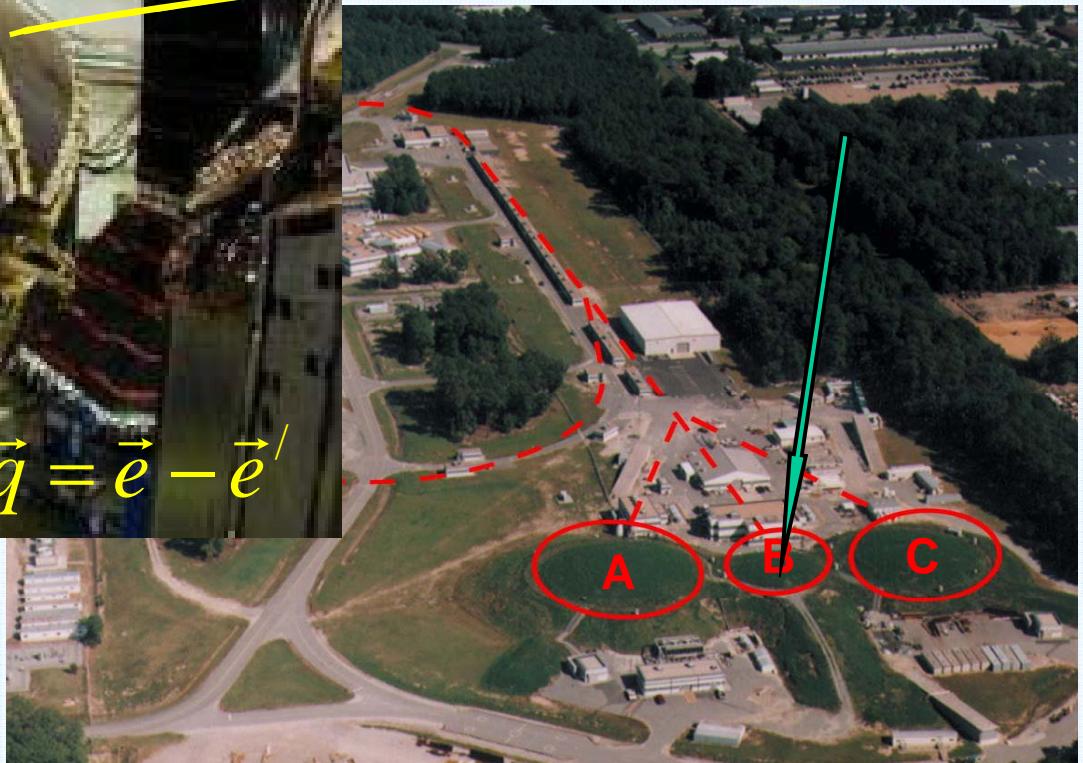

1. Measure different exclusive processes
2. Measure polarization observables

Exclusive Processes in  $N^*$  Studies

# CEBAF at Jefferson Lab and CLAS

$E_{\max}$	$\sim 6 \text{ GeV}$
$I_{\max}$	$\sim 200 \mu\text{A}$
Duty Factor	$\sim 100\%$
$\sigma_E/E$	$\sim 2.5 \cdot 10^{-5}$
Beam P	$\sim 80\%$
$E_{\eta_b}(\text{tagged})$ GeV	$\sim 0.8 - 5.5$

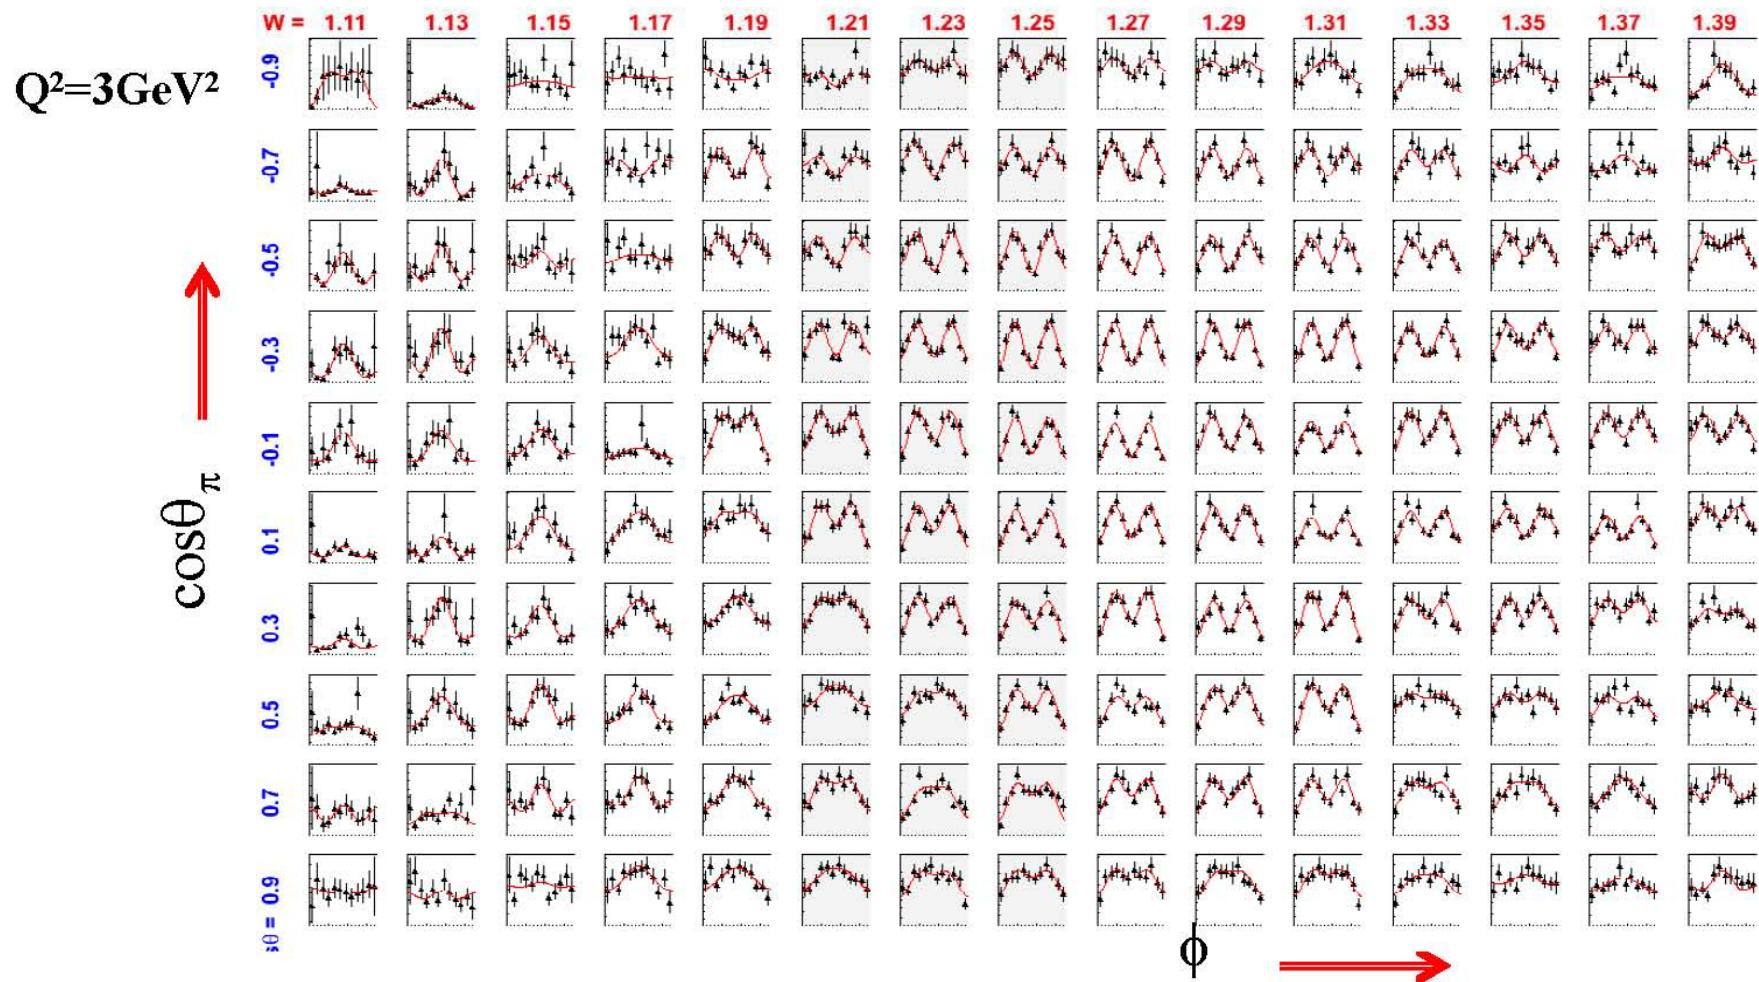

# Electroproduction data and analyses from CLAS

Reaction	$W$ (GeV)	$Q^2$ (GeV $^2$ )	Observable	Physics extracted
$e p \rightarrow e p \pi^0$	1.1 - 1.4	0.4 - 1.8; 3 - 6	$\sigma_T + \varepsilon_L \sigma_L, \sigma_{TT}, \sigma_{LT}; d\sigma/d\Omega$	$\Delta(G_M, R_{EM}, R_{SM})$

10

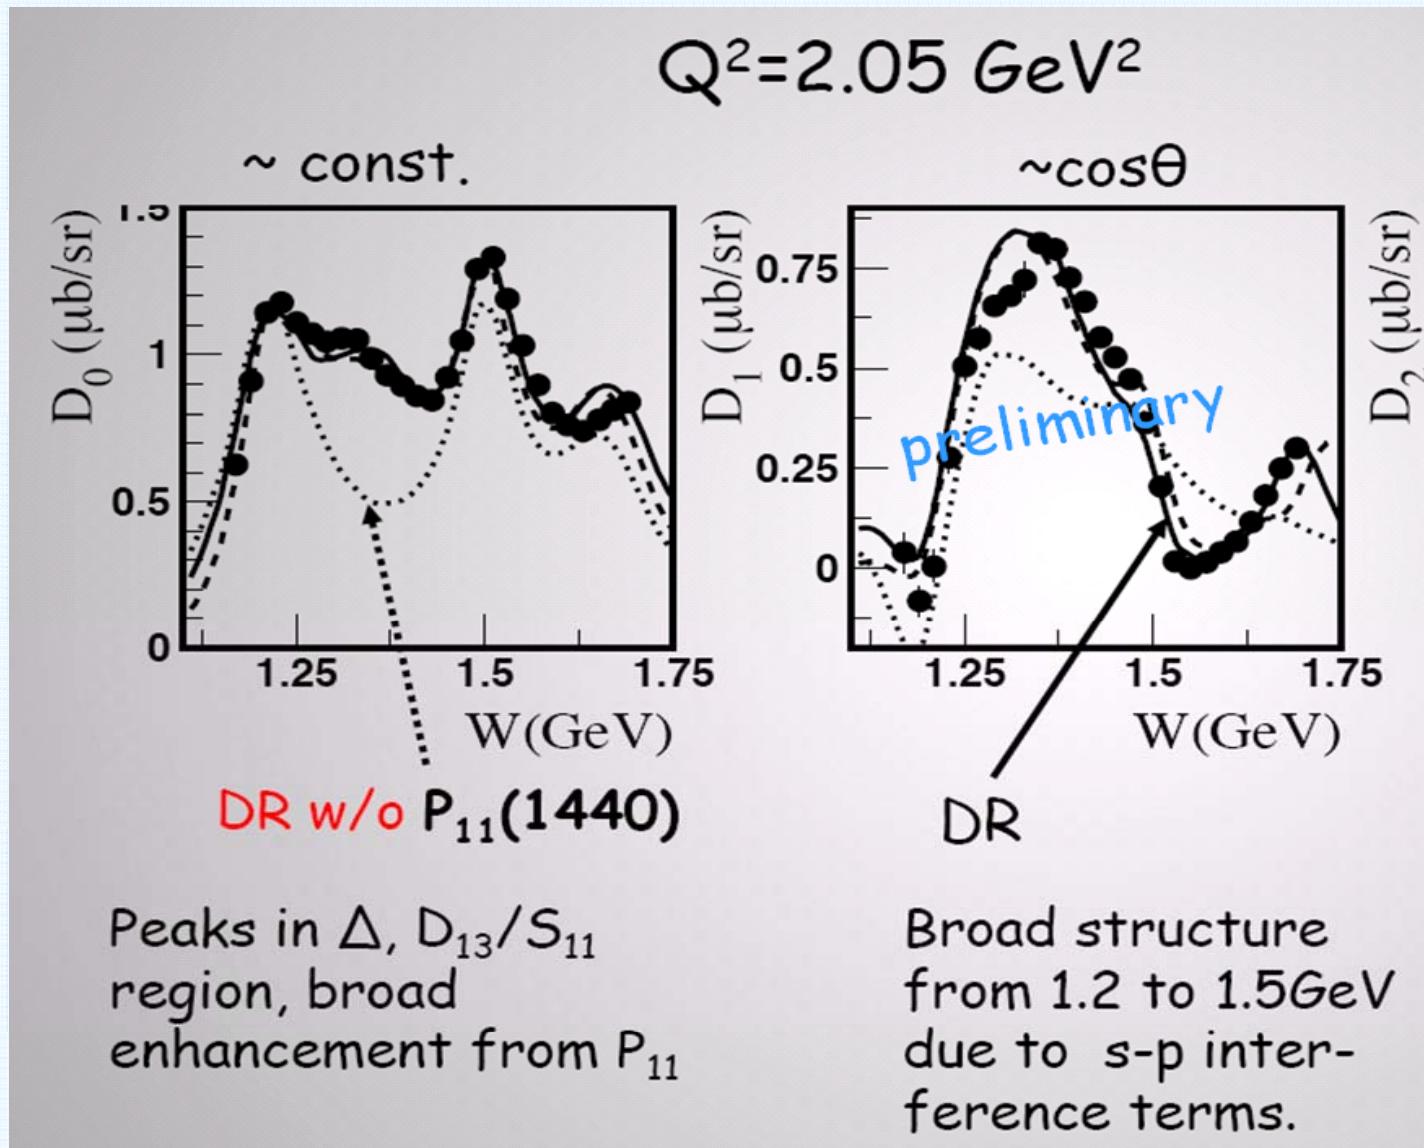

# Legendre Moments of $\sigma_T + \epsilon\sigma_L$

$$\sigma_T + \epsilon\sigma_L = \sum_{l=0}^n D_l^{T+L} P_l(\cos \theta_\pi^*)$$

Delta disappears rapidly with  $Q^2$ , other structures and features remain strong.

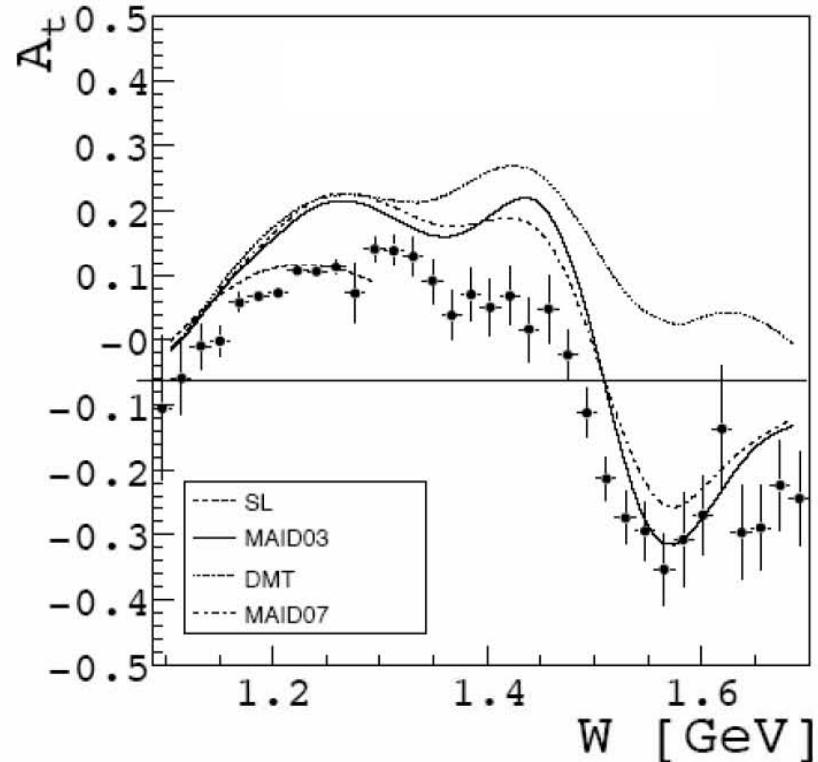

# $P_{11}(1440)$ contributions to Leg. Mom. of $\sigma_T + \varepsilon\sigma_L$

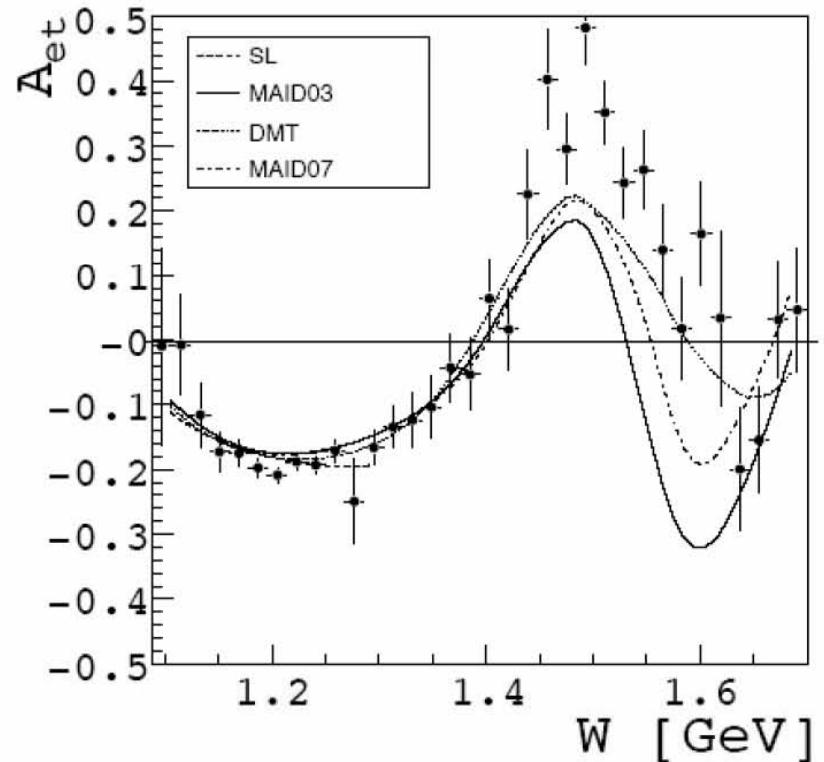

# Integrated Target and Beam-Target Asymmetries

CLAS

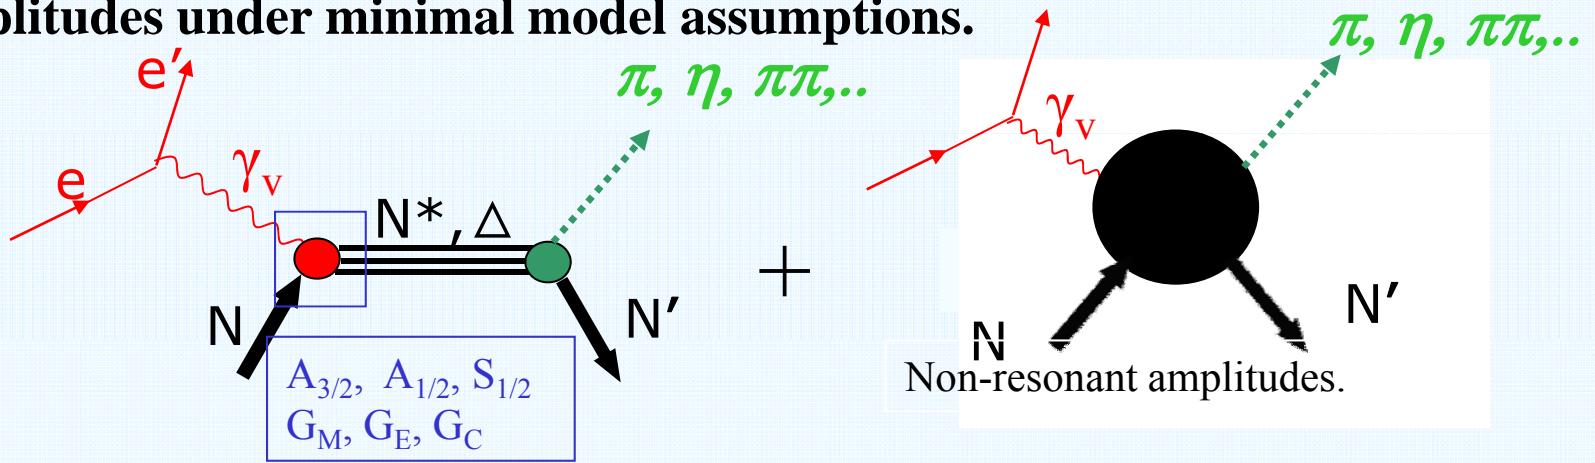

A. Biselli

The asymmetries are integrated over  $\theta^*$  and  $\varphi^*$  in the  $Q^2$  range from 0.187 to 0.770 GeV $^2$  and will further reduce the model dependence of the extracted resonance parameters.

# How $N^*$ electrocouplings can be accessed

- Isolate the resonant part of production amplitudes by fitting the measured observables within the framework of reaction models, which are rigorously tested against data.
- These  $N^*$  electrocouplings can then be determined from resonant amplitudes under minimal model assumptions.

Used Dispersion relations (DR) and Unitary Isobar Model (UIM) Fits

# $\gamma^* p \rightarrow \Delta(1232) P_{33}(1232)$ : $R_{EM}$ and $R_{SM}$

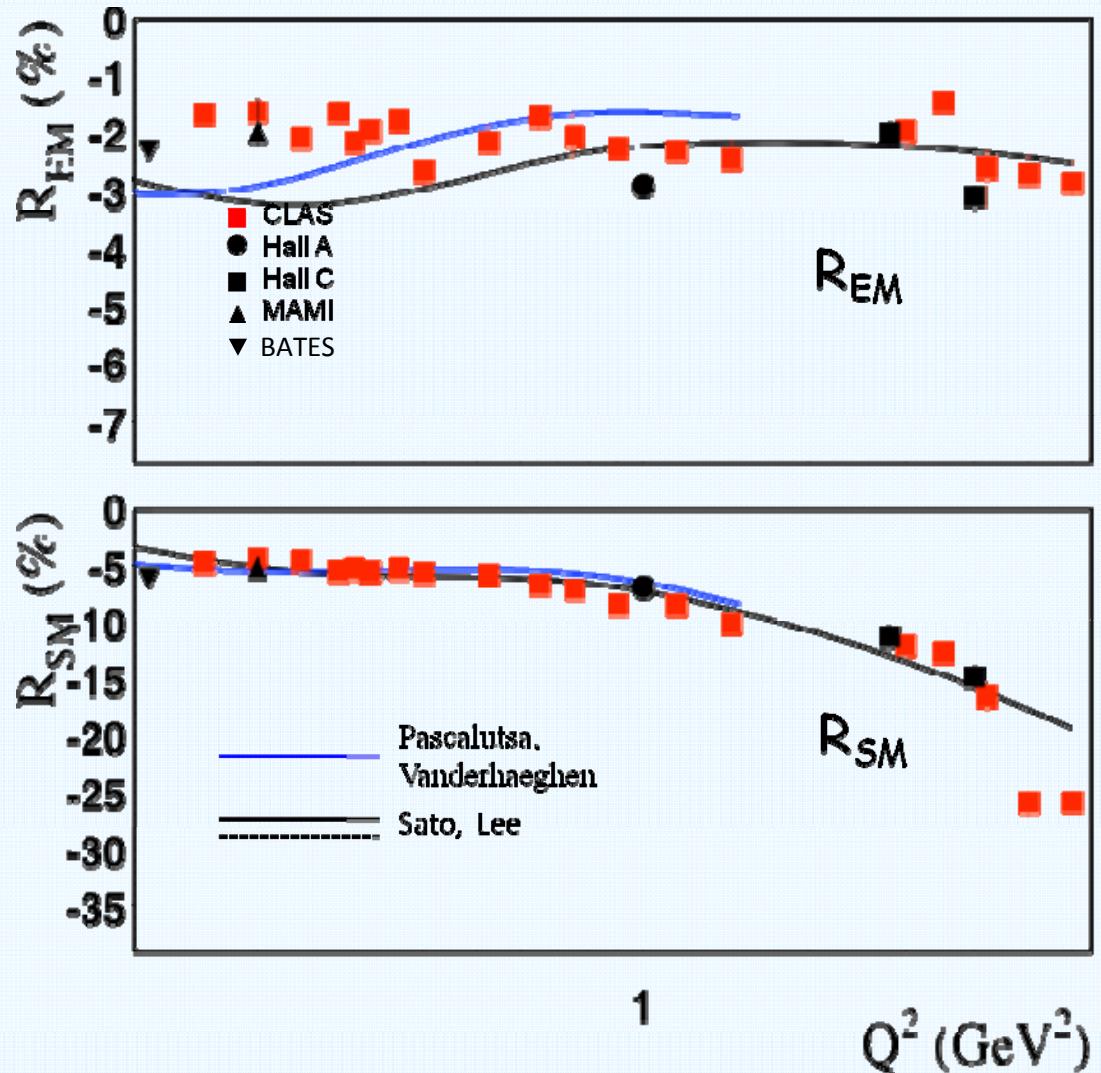

$$R_{EM} = E_{1+}/M_{1+}$$

$$R_{SM} = S_{1+}/M_{1+}$$

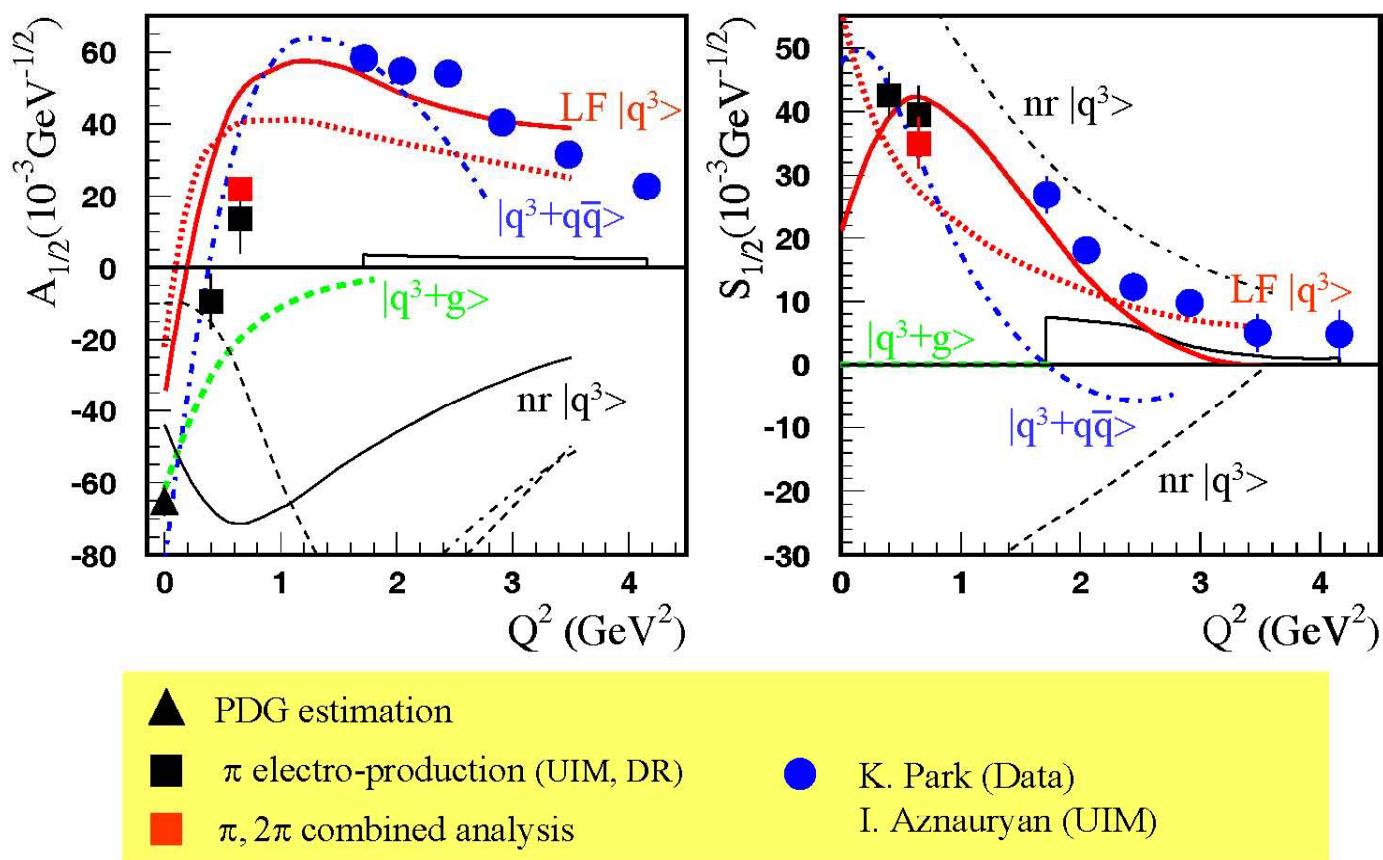

- ✓  $R_{EM} < 0$  favors oblate shape of the  $\Delta$ , prolate shape of the nucleon at large distances
- ✓ Scattering off massless fermions: Helicity is conserved, thus
- ✓  $A_{3/2} = 0 \rightarrow R_{EM} \rightarrow 1, R_{SM} \rightarrow \text{const}$

**We are still far from pQCD asymptotia**

(not shown here)  
 LQCD calculations:  
 encouraging, work in progress...

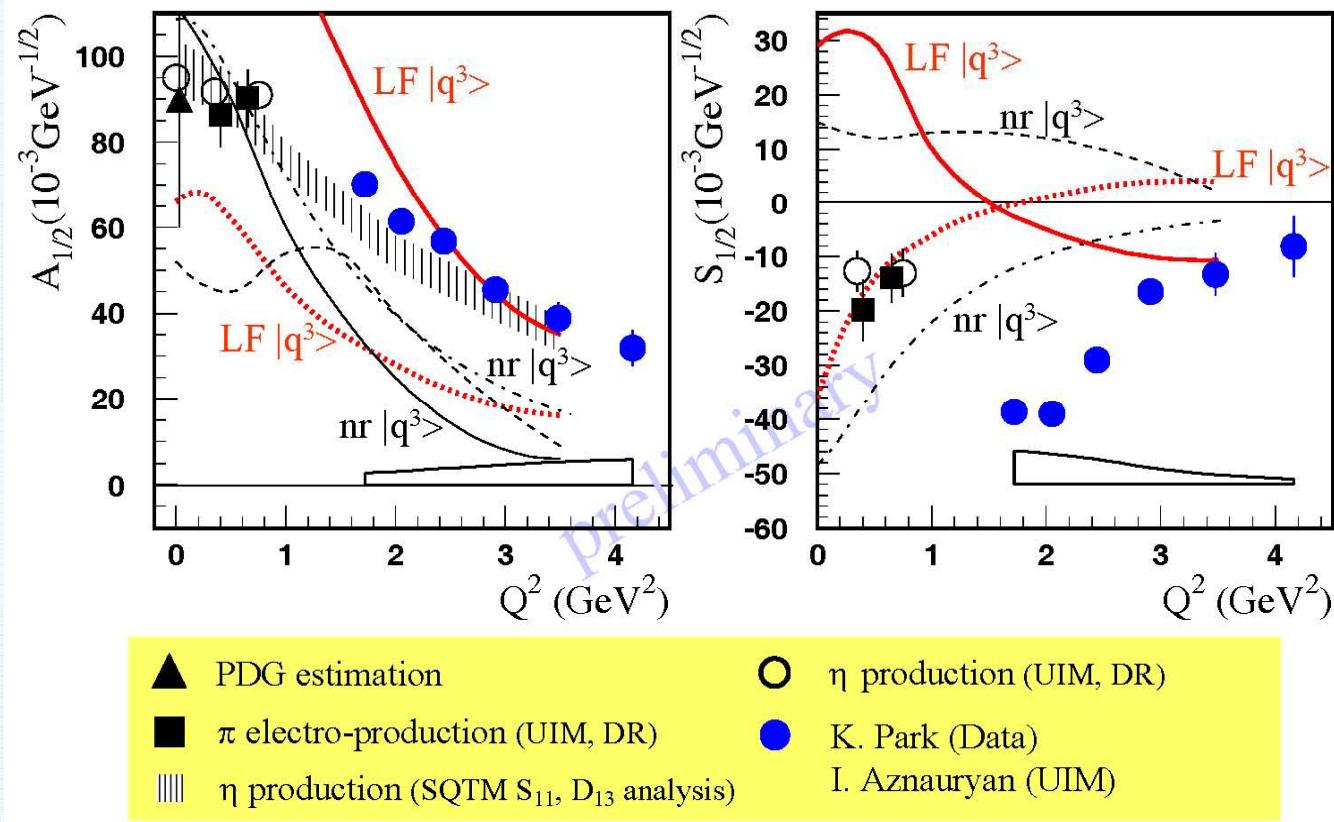

# $\gamma^* p \rightarrow$ Roper $P_{11}(1440)$ Helicity amplitudes

- Sign change of  $A_{1/2}$
- Gluonic excitation ruled out due to  $Q^2$  dependence of both amplitudes.
- High  $Q^2$  behavior consistent with radial excitation of the nucleon as in CQM

# $S_{11}(1520)$ Helicity amplitudes

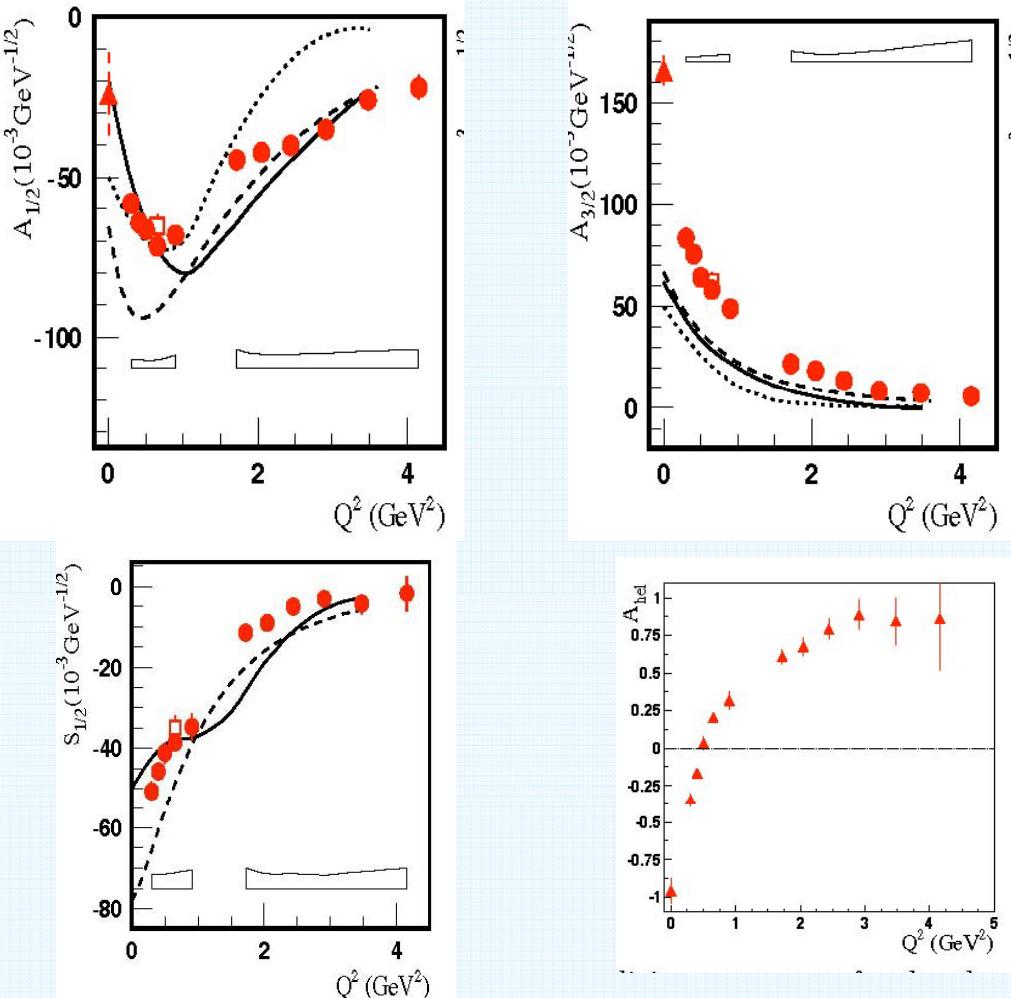

- Hard  $A_{1/2}$  form factor confirmed (Slow fall-off as  $Q^2$ )
- First measurement of  $S_{1/2}$ . Sign inconsistent with CQM.

# Helicity Amplitudes for $\gamma^* p \rightarrow D_{13}(1520)$

$$A_{\text{hel}} = \frac{A_{1/2}^2 - A_{3/2}^2}{A_{1/2}^2 + A_{3/2}^2}$$

CQM predictions:  
 $A_{1/2}$  dominance with  
increasing  $Q^2$ .

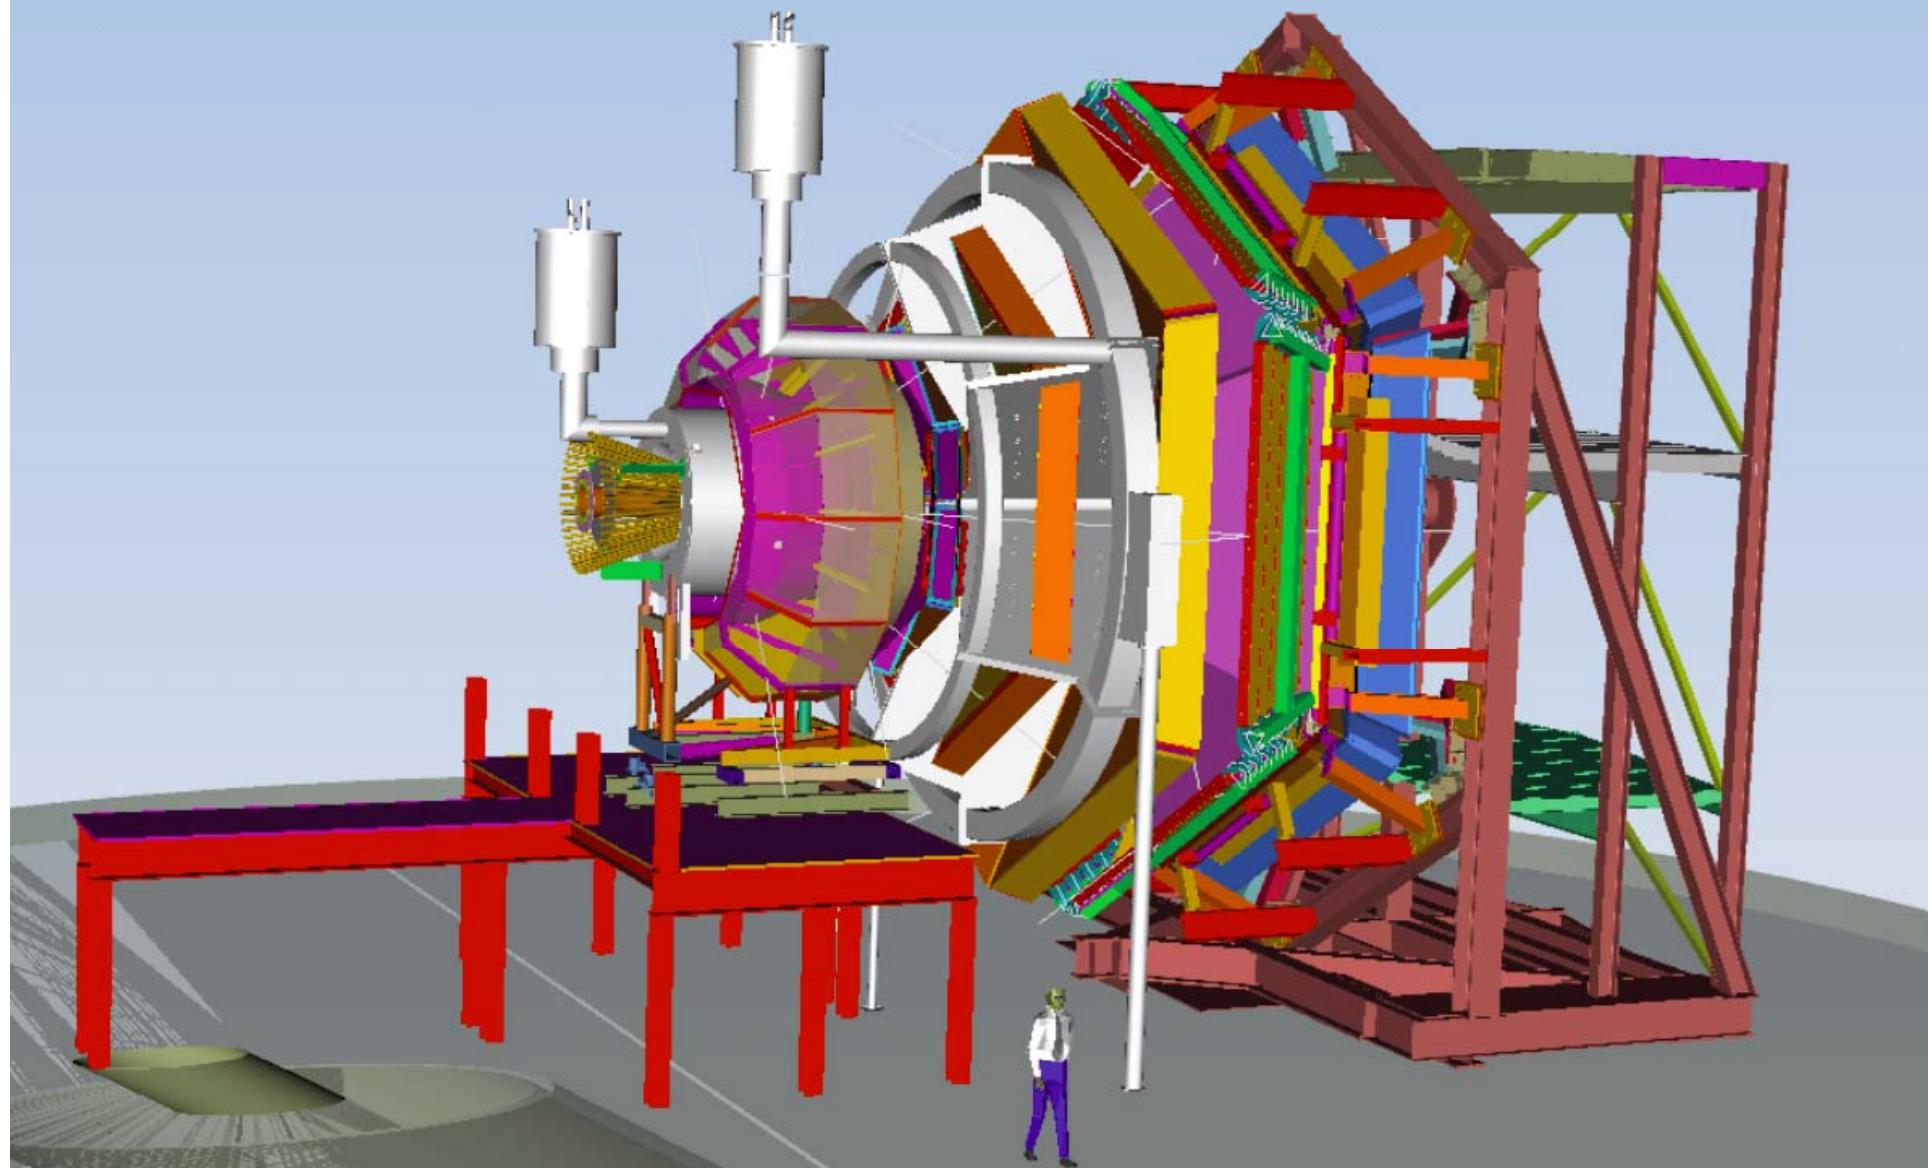

Also from helicity  
conservation.

- Rapid switch of helicity structure from  $A_{3/2}$  dominance to  $A_{1/2}$  dominance at  $Q^2 > 0.6 \text{ GeV}^2$

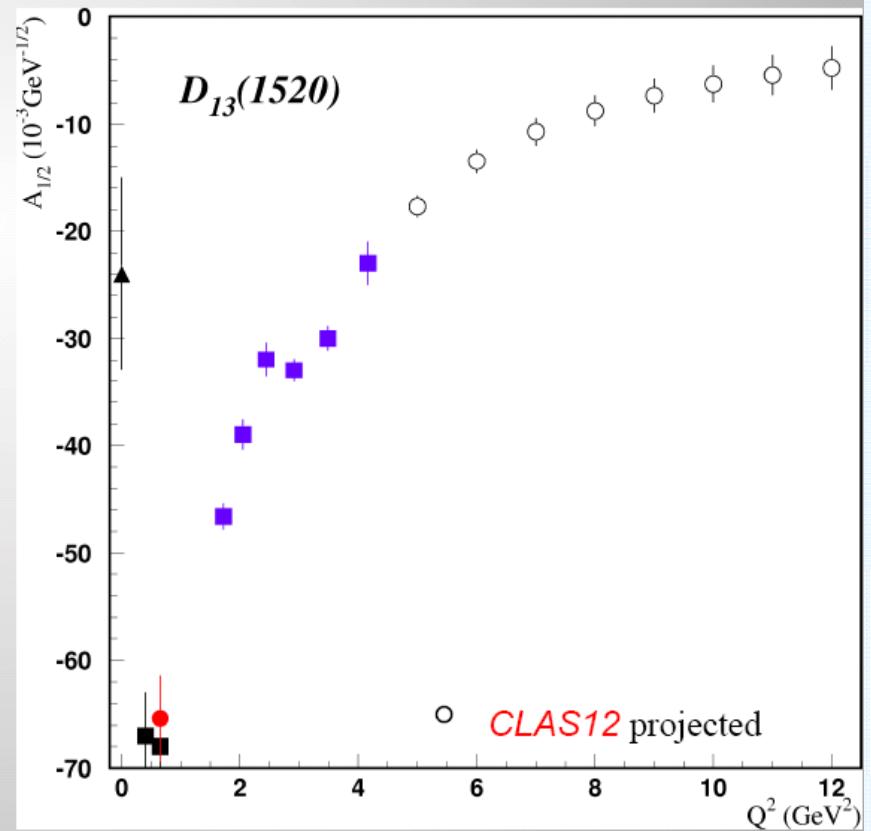

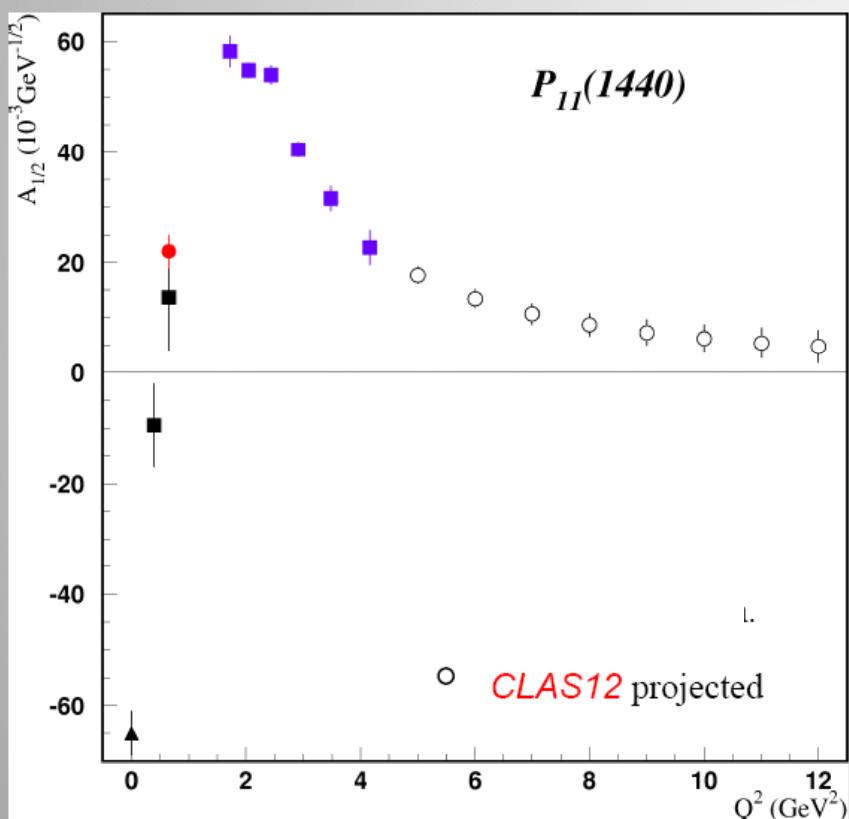

# CLAS12 - Detector

---

# Projections for $N^*$ Transition Amplitudes @ 12 GeV

Probe the transition from effective degrees of freedom, e.g. constituent quarks, to elementary quarks, with characteristic  $Q^2$  dependence.

## Summary

---

- New accurate measurements on  $Q^2$  dependence of transition form factors of low lying excited states of the nucleon.
- More analysis results on transition form factors of higher mass states.
- Extensive program is underway with polarized photon beams and polarized targets to search for new baryon states.
- Approved proposal for a transition form factor program at high  $Q_2$  at the Jlab 12 GeV upgrade with CLAS12.
