

Monte Carlo modelling of NLO DGLAP QCD Evolution in the fully unintegrated form

Reinventing the Parton Shower Monte Carlo

More in <http://jadach.web.cern.ch/>

Can we construct NLO Parton Shower Monte Carlo for QCD Initial State Radiation:

- based firmly on Feynman Diagrams (ME) and LIPS,
- based rigorously on the collinear factorisation (EGMPR, CSS, Bodwin...),
- implementing *exactly* NLO DGLAP evolution,
- for fully unintegrated exclusive PDFs (ePDFs);
- with NLO evolution done by the MC itself,
using new Exclusive NLO kernels ???

We are going to show that YES! We can do it!

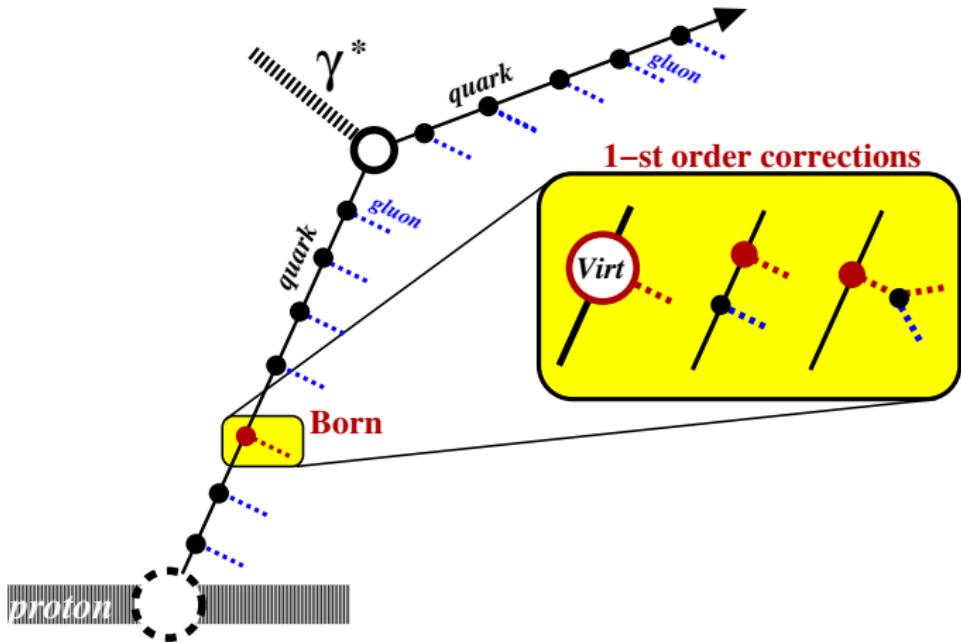

And report on the first Monte Carlo implementation
– the proof of the concept for non-singlet NLO DGLAP.

Leading Order (LO) ladder vertex is our “Born”

Emission of gluons out of quark

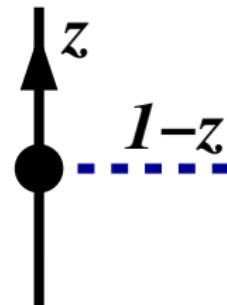

The aim is to implement in the Monte Carlo complete NLO DGLAP in the initial state ladder, using unintegrated Feynman diagrams of Curci-Furmanski-Petronzio scheme (axial gauge).

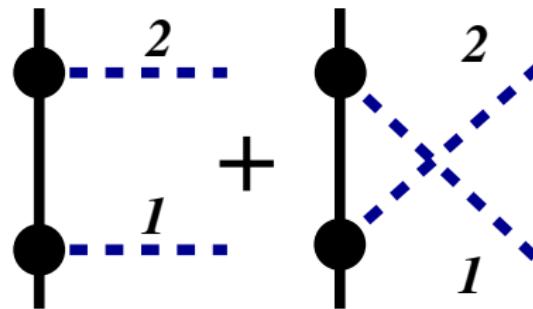

1-st order virtual and real correction diagrams

Virtual :

$$(1 + \Delta_{ISR}^{(1)}(z))$$

Real :

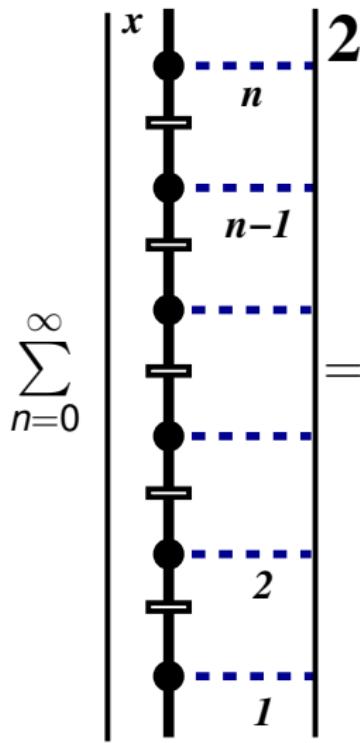

NOTATION: squared MEs = cut-diagrams, C_F^2 only

$$\left| \begin{array}{c} \text{Diagram 1} \\ + \\ \text{Diagram 2} \end{array} \right|^2 = \left| \begin{array}{c} \text{Diagram 1} \\ + \\ \text{Diagram 3} \\ + 2 \cdot \text{Diagram 4} \end{array} \right|^2$$

$$\left| \begin{array}{c} z \\ \text{Diagram 5} \\ 1-z \end{array} \right|^2 = \text{Diagram 6}, \quad \left| \begin{array}{c} \text{Diagram 7} \\ \text{Diagram 8} \end{array} \right|^2 = \text{Diagram 9}$$

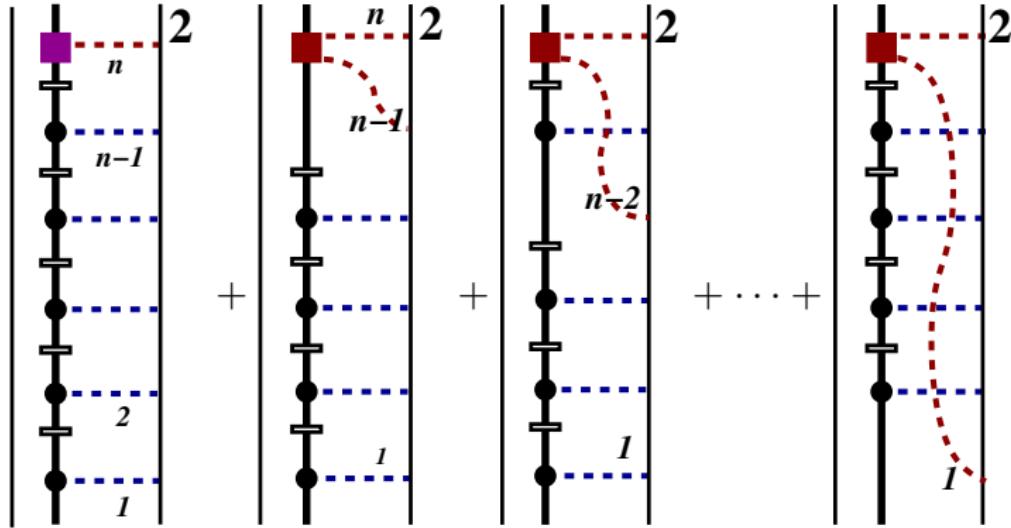

LO ladder = parton shower MC

$$a_i = \frac{k_i^T}{\alpha_i}, \quad \alpha_i = \frac{k_i^+}{2E_h}, \quad \rho_{1B}^{(0)}(k_i) = \frac{2C_F^2 \alpha_s}{\pi} \frac{1}{k_i^{T2}} \frac{1+z^2}{2}.$$

LO with NLO-corrected kernel at the end of the ladder

Virt. multiplicative

Undoung LO simplificat.

Sum over trailing LO spectators, essential (BE, YFS61)

$$\left| \begin{array}{c} \uparrow \\ \text{purple square} \\ \cdots \\ \text{blue square} \end{array} \right|^2 = (1 + 2\Re(\Delta_{ISR}^{(1)})) \left| \begin{array}{c} z \\ \cdots \\ 1-z \end{array} \right|^2,$$

$$\left| \begin{array}{c} \uparrow \\ \text{red square} \\ \cdots \\ \text{blue square} \end{array} \right|^2 = \left| \begin{array}{c} \cdots \\ \text{black dot} \\ \text{black dot} \\ \cdots \\ \text{blue square} \end{array} \right|^2 + \left| \begin{array}{c} \cdots \\ \text{black dot} \\ \text{black dot} \\ \cdots \\ \text{blue square} \end{array} \right|^2 - \left| \begin{array}{c} \cdots \\ \text{black dot} \\ \text{black dot} \\ \cdots \\ \text{black rectangle} \end{array} \right|^2$$

LO with NLO-corrected end-ladder kernel, $\sim C_F^2$

With more details:

$$\bar{D}_B^{[1]}(x, Q) = e^{-S_{ISR}} \left(\begin{array}{c} x \\ \vdots \\ n \\ \vdots \\ n-I \\ \vdots \\ 2 \\ \vdots \\ I \end{array} \right| 2 + e^{-S_{ISR}} \left(\begin{array}{c} \textcolor{violet}{\blacksquare} \\ \vdots \\ n \\ \vdots \\ n-I \\ \vdots \\ 2 \\ \vdots \\ I \end{array} \right| 2 + e^{-S_{ISR}} \sum_{j=1}^{n-1} \left(\begin{array}{c} \textcolor{red}{\blacksquare} \\ \vdots \\ j \\ \vdots \\ n-1 \\ \vdots \\ 2 \\ \vdots \\ I \end{array} \right| 2 \right) = e^{-S_{ISR}} \left\{ \delta_{x=1} + \right. \\ \left. + \sum_{n=1}^{\infty} \left(\prod_{i=1}^n \int_{Q > a_i > a_{i-1}} d^3 \eta_i \rho_{1B}^{(1)}(k_i) \right) \left[\beta_0^{(1)}(z_n) + \sum_{j=1}^{n-1} W(\tilde{k}_n, \tilde{k}_j) \right] \delta_{x=\prod_{j=1}^n x_j} \right\},$$

$$\text{where } d\eta_i = \frac{d^3 k_i}{k_i^0}, \quad \beta_0^{(1)} = \left| \begin{array}{c} \textcolor{violet}{\blacksquare} \\ \vdots \\ z \\ \vdots \\ 1-z \end{array} \right| 2, \quad W(k_2, k_1) = \left| \begin{array}{c} \textcolor{red}{\blacksquare} \\ \vdots \\ 2 \\ \vdots \\ 1 \\ \vdots \\ 2 \\ \vdots \\ 1 \end{array} \right| 2 = \left| \begin{array}{c} \textcolor{black}{\blacksquare} \\ \vdots \\ 2 \\ \vdots \\ 1 \\ \vdots \\ 2 \\ \vdots \\ 1 \end{array} \right| 2 + \left| \begin{array}{c} \textcolor{black}{\blacksquare} \\ \vdots \\ 2 \\ \vdots \\ 1 \\ \vdots \\ 2 \\ \vdots \\ 1 \end{array} \right| 2 - 1.$$

Mapping $k_i \rightarrow \tilde{k}_i$, essential and instrumental.

S_{ISR} = double-log Sudakov.

Algebraic crosscheck

For NLO part the analytical integration gives us:

$$\begin{aligned}\bar{D}_B^{[1]}(x, Q) = & \left\{ \prod_{i=1}^{n-1} \int_{Q > a_i > a_{i-1}} d^3 \eta_i \rho_{1B}^{(1)}(k_i) \right\} \delta_{x=u \prod_{j=1}^{n-1} z_j} = e^{-S_{ISR}} \left\{ \delta_{x=1} + \right. \\ & \left. + \sum_{n=1}^{\infty} \int du \int \frac{da_n}{a_n} \mathcal{P}_{qq}^{(1)}(u) \left(\prod_{i=1}^{n-1} \int_{a_{i+1} > a_i > a_{i-1}} \frac{da_n}{a_i} \mathcal{P}_{qq}^{(0)}(z_i) \right) \delta_{x=u \prod_{j=1}^{n-1} z_j} \right.\end{aligned}$$

where we recover precisely NLO part of standard DGLAP kernel $\mathcal{P}_{qq}^{(1)}(u)$ defined according to:

$$\mathcal{P}_{qq}^{(1)}(u) \ln \frac{Q}{q_0} = \int_{Q > a_n > a_0} d^3 \eta_n \rho_{1B}^{(1)}(k_n) \beta_0^{(1)}(z_n) \delta_{u=z_n} + \int_{Q > a_n > a_0} d^3 \eta_{n'} \int_{a_n > a_{nn'} > 0} d^3 \eta_{n'} \beta_1^{(1)}(\tilde{k}_n, \tilde{k}_{n'}) \delta_{u=z_n z_{n'}}$$

One NLO standard inclusive kernel of DGLAP truly reproduced.

Position of the NLO correction/insertion p can be anywhere in the ladder and we sum up over p :

$$\bar{D}_B^{[1]}(x, Q) = e^{-S_{ISR}} \sum_{n=0}^{\infty} \left\{ \begin{array}{c} \text{Diagram with } n \text{ rungs, top } x, \text{ bottom } I, \text{ right } 2 \\ \text{Diagram with } n \text{ rungs, top } x, \text{ bottom } I, \text{ right } 2 \\ \text{Diagram with } n \text{ rungs, top } x, \text{ bottom } I, \text{ right } 2 \end{array} \right. + \sum_{p=1}^n \left\{ \begin{array}{c} \text{Diagram with } n \text{ rungs, top } x, \text{ bottom } I, \text{ right } 2 \\ \text{Diagram with } n \text{ rungs, top } x, \text{ bottom } I, \text{ right } 2 \\ \text{Diagram with } n \text{ rungs, top } x, \text{ bottom } I, \text{ right } 2 \end{array} \right. + \sum_{p=1}^n \sum_{j=1}^{p-1} \left\{ \begin{array}{c} \text{Diagram with } n \text{ rungs, top } x, \text{ bottom } I, \text{ right } 2 \\ \text{Diagram with } n \text{ rungs, top } x, \text{ bottom } I, \text{ right } 2 \\ \text{Diagram with } n \text{ rungs, top } x, \text{ bottom } I, \text{ right } 2 \end{array} \right. \right\} = e^{-S_{ISR}} \left\{ \delta_{x=1} + \right. \\ \left. + \sum_{n=1}^{\infty} \left(\prod_{i=1}^n \int_{Q > a_i > a_{i-1}} d^3 \eta_i \rho_{1B}^{(1)}(k_i) \right) \left[\sum_{p=1}^n \beta_0^{(1)}(z_p) + \sum_{p=1}^n \sum_{j=1}^{p-1} W(\tilde{k}_p, \tilde{k}_j) \right] \delta_{x=\prod_{j=1}^n x_j} \right\},$$

Next step is to add more insertions, for instance 2 at positions p_1 and p_2 and sum up over positions... then 3 insertions and so non – in this way we build up LO+NLO kernels all over along the ladder! See next slide...

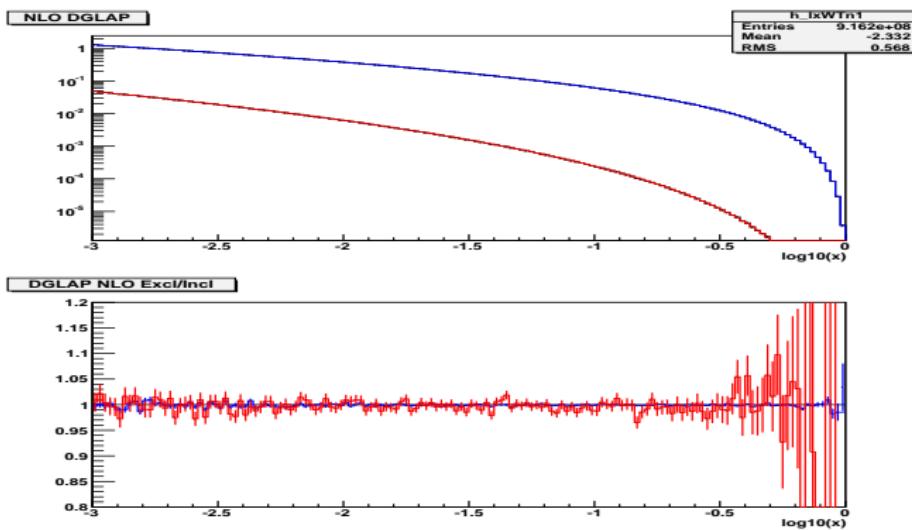

NLO-corrected kernels all over the ladder, $\sim C_F^2$

$$\begin{aligned}
 \bar{D}_B^{[1]}(x, Q) &= e^{-S_{ISR}} \sum_{n=0}^{\infty} \left\{ \text{Diagram 1} + \sum_{p_1=1}^n \sum_{j_1=1}^{p_1-1} \text{Diagram 2} + \sum_{p_1=1}^n \sum_{p_2=1}^{p_1-1} \sum_{\substack{j_1=1 \\ j_1 \neq p_2}}^{p_1-1} \sum_{\substack{j_2=1 \\ j_2 \neq p_1, j_2}}^{p_2-1} \text{Diagram 3} \right\} \\
 &= e^{-S_{ISR}} \left\{ \delta_{x=1} + \sum_{n=1}^{\infty} \left(\prod_{i=1}^n \int_{Q > a_i > a_{i-1}} d^3 \eta_i \rho_{1B}^{(1)}(k_i) \beta_0^{(1)}(z_p) \right) \left[1 + \sum_{p=1}^n \sum_{j=1}^{p-1} \textcolor{blue}{W}(\tilde{k}_p, \tilde{k}_j) + \right. \right. \\
 &\quad \left. \left. + \sum_{p_1=1}^n \sum_{p_2=1}^{p_1-1} \sum_{\substack{j_1=1 \\ j_1 \neq p_2}}^{p_1-1} \sum_{\substack{j_2=1 \\ j_2 \neq p_1, j_2}}^{p_2-1} \textcolor{red}{W}(\tilde{k}_{p_1}, \tilde{k}_{j_1}) W(\tilde{k}_{p_2}, \tilde{k}_{j_2}) + \dots \right] \delta_{x=\prod_{j=1}^n x_j} \right\},
 \end{aligned}$$

The above has been tested with 3-digit precision in the MC prototype, see next slide.

Numerical test of ISR pure C_F^2 NLO MC

Numerical results for $D(x, Q)$ from inclusive and exclusive **two** Monte Carlos.
Blue curve is single NLO insertion, red curve is double insertion component.
LO+NLO is off scale. Evolution $10\text{GeV} \rightarrow 1\text{TeV}$ starting from $\delta(1 - x)$.
The ratio demonstrates 3-digit agreement, in units of LO.

THE PROBLEM WITH GLUON PAIR COMPONENT OF the NLO KERNEL, $\sim C_F C_A$ (FSR)

Straightforward inclusion of gluon pair diagram in the previous method would ruin Monte Carlo weight due to presence of Sudakov double logarithmic $+S_{FSR}$ in 2-real correction:

$$\left| \begin{array}{c} \uparrow \\ | \\ \textcolor{red}{\blacksquare} \\ | \\ \downarrow \end{array} \right|^2 = \left| \begin{array}{c} \bullet \\ | \\ \bullet \\ | \\ \bullet \end{array} + \begin{array}{c} \bullet \\ | \\ \bullet \\ | \\ \bullet \end{array} + \begin{array}{c} \bullet \\ | \\ \bullet \\ | \\ \bullet \end{array} \right|^2 - \left| \begin{array}{c} \bullet \\ | \\ \textcolor{brown}{\boxed{\bullet}} \\ | \\ \bullet \end{array} \right|^2$$

and $-S_{FSR}$ in the virtual correction:

$$\left| \begin{array}{c} \uparrow \\ | \\ \textcolor{violet}{\blacksquare} \\ | \\ \downarrow \end{array} \right|^2 = (1 + 2\Re(\Delta_{ISR} + V_{FSR})) \left| \begin{array}{c} \uparrow^z \\ | \\ \bullet \\ | \\ \downarrow^{1-z} \end{array} \right|^2.$$

SOLUTION: Resummation/exponentiation of FSR, see next slides for details of the scheme and numerical test of the prototype MC.

Additional NLO FSR corr. at the end of the ladder:

$$e^{-S_{ISR} - S_{FSR}} \sum_{n,m=0}^{\infty} \sum_{r=1}^m \left| \begin{array}{c} \text{Diagram showing a ladder diagram with gluons (red boxes) and quarks (black dots). A red box at the top is connected to a gluon line. Dashed blue lines labeled } n-1, n-2, I, 2, r, m \text{ connect the gluons.} \\ \text{Diagram showing a ladder diagram with gluons (red boxes) and quarks (black dots). A red box at the top is connected to a gluon line. Dashed blue lines labeled } n-1, n-2, I, 2, r, m \text{ connect the gluons.} \end{array} \right|^2$$

where Sudakov S_{FSR} is subtracted in the virtual part:

$$\left| \begin{array}{c} \text{Diagram showing a gluon line with a red box and a dashed blue line.} \end{array} \right|^2 = (1 + 2\Re(\Delta_{ISR} + V_{FSR} - S_{FSR})) \left| \begin{array}{c} \text{Diagram showing a gluon line with a black dot and a dashed blue line.} \end{array} \right|^2.$$

and FSR counterterm is subtracted in the 2-real-gluon part:

$$\left| \begin{array}{c} \text{Diagram showing a gluon line with a red box and a dashed blue line.} \end{array} \right|^2 = \left| \begin{array}{c} \text{Diagram showing a gluon line with a black dot and a dashed blue line.} \end{array} \right|^2 + \left| \begin{array}{c} \text{Diagram showing a gluon line with a black dot and a dashed blue line.} \end{array} \right|^2 + \left| \begin{array}{c} \text{Diagram showing a gluon line with a black dot and a dashed blue line.} \end{array} \right|^2 - \left| \begin{array}{c} \text{Diagram showing a gluon line with a red box and a dashed blue line.} \end{array} \right|^2 - \left| \begin{array}{c} \text{Diagram showing a gluon line with a red box and a dashed blue line.} \end{array} \right|^2.$$

The miracle: both are free of any collinear or soft divergency!!!

ISR+FSR NLO scheme, NLO corr. at end of the ladder

$$\bar{D}_{NS}^{[1]}(x, Q) =$$

$$e^{-S} \sum_{n,m=0}^{\infty} \left\{ \begin{array}{c} \text{Diagram 1: } \text{A vertical line with } n \text{ black dots and } m \text{ blue dashed segments. Labels } I, 2, \dots, n-1, n-2, I \text{ are placed along the line.} \\ \text{Diagram 2: } \text{Similar to Diagram 1, but with a red dashed loop around the middle section labeled } j. \\ \text{Diagram 3: } \text{Similar to Diagram 1, but with a red dashed loop around the top section labeled } r. \end{array} \right| ^2 + \sum_{j=1}^{n-1} \left| \text{Diagram 2} \right|^2 + \sum_{r=1}^m \left| \text{Diagram 3} \right|^2 \right\}$$

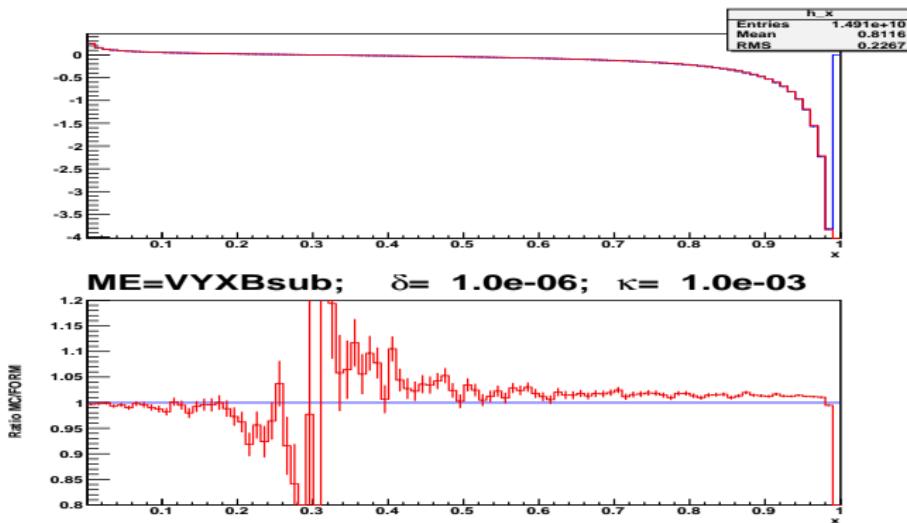

$$= e^{-S_{ISR}} \left\{ \delta_{x=1} + \sum_{n=1}^{\infty} \left(\prod_{i=1}^n \int_{Q > a_i > a_{i-1}} d^3 \eta_i \rho_{1B}^{(1)}(k_i) \right) e^{-S_{FSR}} \sum_{m=0}^{\infty} \left(\prod_{j=1}^m \int_{Q > a_{nj} > a_{n(j-1)}} d^3 \eta'_j \rho_{1V}^{(1)}(k'_j) \right) \right. \\ \times \left. \left[\beta_0^{(1)}(z_n) + \sum_{j=1}^{n-1} W(\tilde{k}_n, \tilde{k}_j) + \sum_{r=1}^m W(\tilde{k}_n, \tilde{k}'_r) \right] \delta_{x=\prod_{j=1}^n x_j} \right\}$$

$$\beta_0^{(1)} \equiv \left| \begin{array}{c} \text{Diagram 4: } \text{A vertical line with a red square at the top, a black dot in the middle, and a blue dashed segment at the bottom. Labels } z, I-z \text{ are on the sides.} \end{array} \right|^2, \quad W(k_2, k_1) \equiv \frac{\left| \begin{array}{c} \text{Diagram 5: } \text{A vertical line with a red square at the top, a black dot in the middle, and a blue dashed segment at the bottom. Labels } 2, I \text{ are on the sides.} \\ + \text{ Diagram 6: } \text{A vertical line with a red square at the top, a black dot in the middle, and a blue dashed segment at the bottom. Labels } 2, I \text{ are on the sides.} \end{array} \right|^2}{\left| \begin{array}{c} \text{Diagram 7: } \text{A vertical line with a red square at the top, a black dot in the middle, and a blue dashed segment at the bottom. Labels } 2, I \text{ are on the sides.} \\ + \text{ Diagram 8: } \text{A vertical line with a red square at the top, a black dot in the middle, and a blue dashed segment at the bottom. Labels } 2, I \text{ are on the sides.} \end{array} \right|^2} = \frac{\left| \begin{array}{c} \text{Diagram 9: } \text{A vertical line with a red square at the top, a black dot in the middle, and a blue dashed segment at the bottom. Labels } 2, I \text{ are on the sides.} \\ + \text{ Diagram 10: } \text{A vertical line with a red square at the top, a black dot in the middle, and a blue dashed segment at the bottom. Labels } 2, I \text{ are on the sides.} \end{array} \right|^2}{\left| \begin{array}{c} \text{Diagram 11: } \text{A vertical line with a red square at the top, a black dot in the middle, and a blue dashed segment at the bottom. Labels } 2, I \text{ are on the sides.} \\ + \text{ Diagram 12: } \text{A vertical line with a red square at the top, a black dot in the middle, and a blue dashed segment at the bottom. Labels } 2, I \text{ are on the sides.} \end{array} \right|^2} - 1.$$

3-digit precision numerical test of FSR methodology

Numerical test done for single NLO ISR+FSR insertion
for $n = 1, 2$ ISR gluons and infinite no. of FSR gluons:

because in this case analytical integration is feasible.
MC agrees precisely with the analytical result.

Summary and Prospects

- First serious **feasibility study** of the true NLO exclusive MC parton shower is almost complete for non-singlet NLO DGLAP. It works!!!
- Short range aim: Complete non-singlet.
- Middle range aim: Complete singlet (Q-G transitions).
- Optimise MC weight evaluation (CPU time).
- Adding NLO hard process into the game (similar to MC@NLO).
- Complete NLO MC for DIS@HERA and W/Z prod. @LHC.
- Extensions towards CCFM/BFKL, quark masses, fitting PDFs with Monte Carlo.
