

# THE MINERVA EXPERIMENT

Heidi Schellman DIS 2010

# Outline

2

- MINERvA Goals
- MINERvA detector
- MINERvA data
- MINERvA future

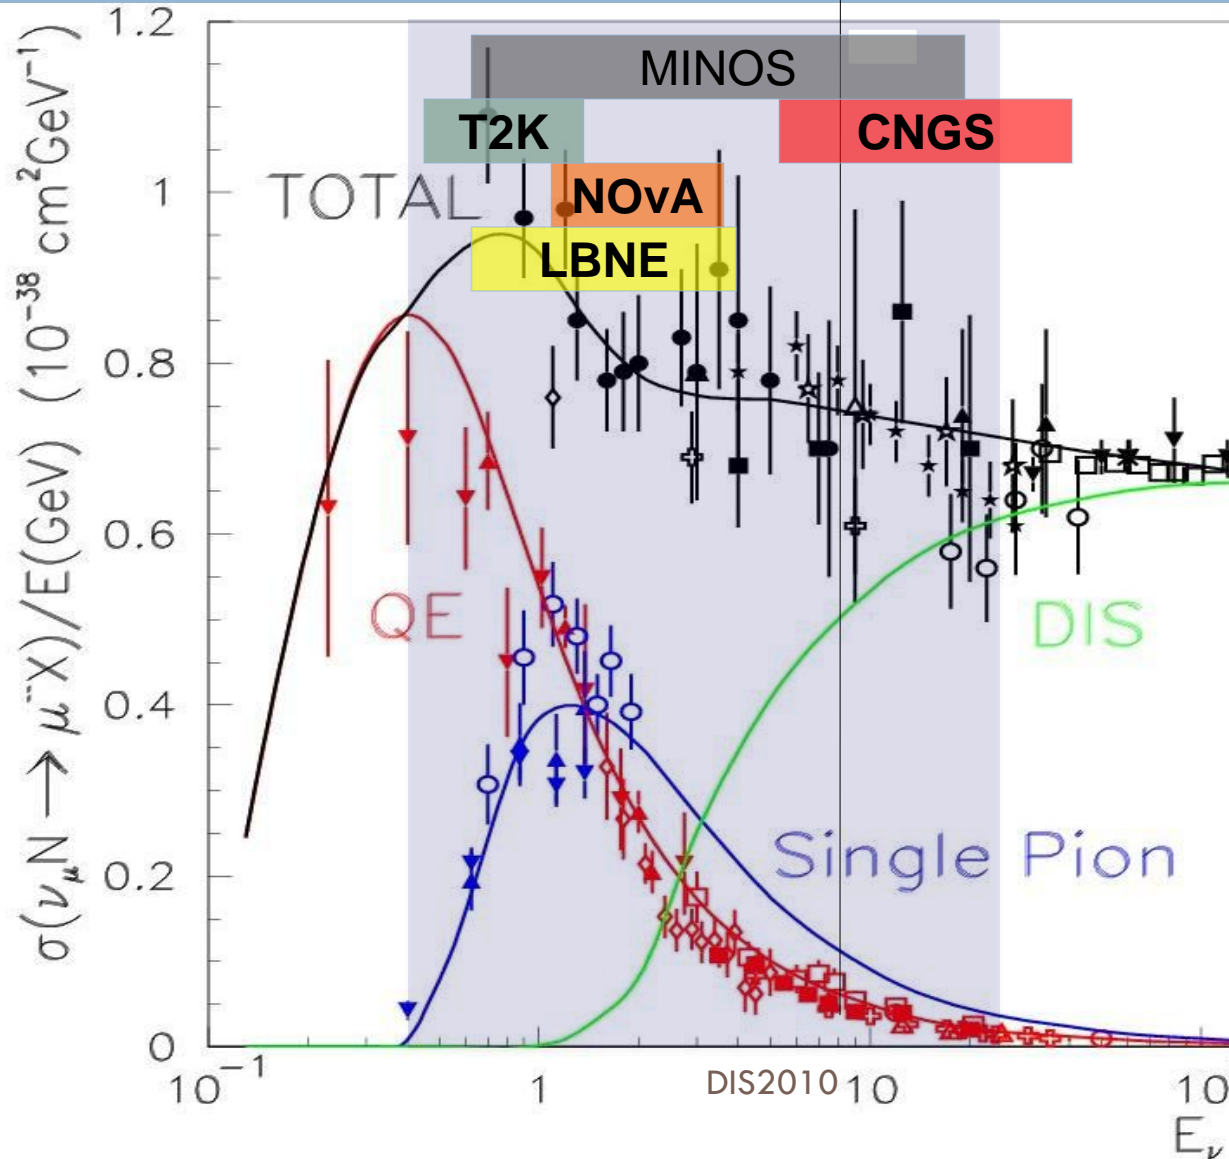

# MINERvA GOALS

3

- High precision measurements of neutrino scattering cross sections.
  - ▣ Fine granularity
  - ▣ High statistics in the NuMI beam
  - ▣ Mainly C (scintillator) but also nuclear targets
- Goals
  - ▣ Basic understanding of neutrino interactions in the 1-10 GeV range.
  - ▣ Important inputs for neutrino oscillation experiments

# Neutrino Charged Current Cross Sections

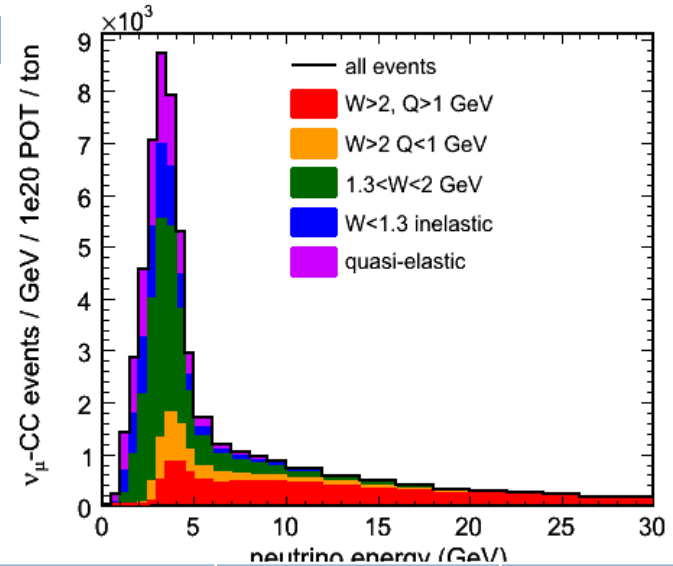

4

# Monte Carlo Estimated Event Yields

5

- If assume
  - $4 \times 10^{20}$  POT LE
  - $12 \times 10^{20}$  POT ME
- Results in **~14 million CC** events
  - ~9 million on scintillator
  - ~5 million on nuclear targets

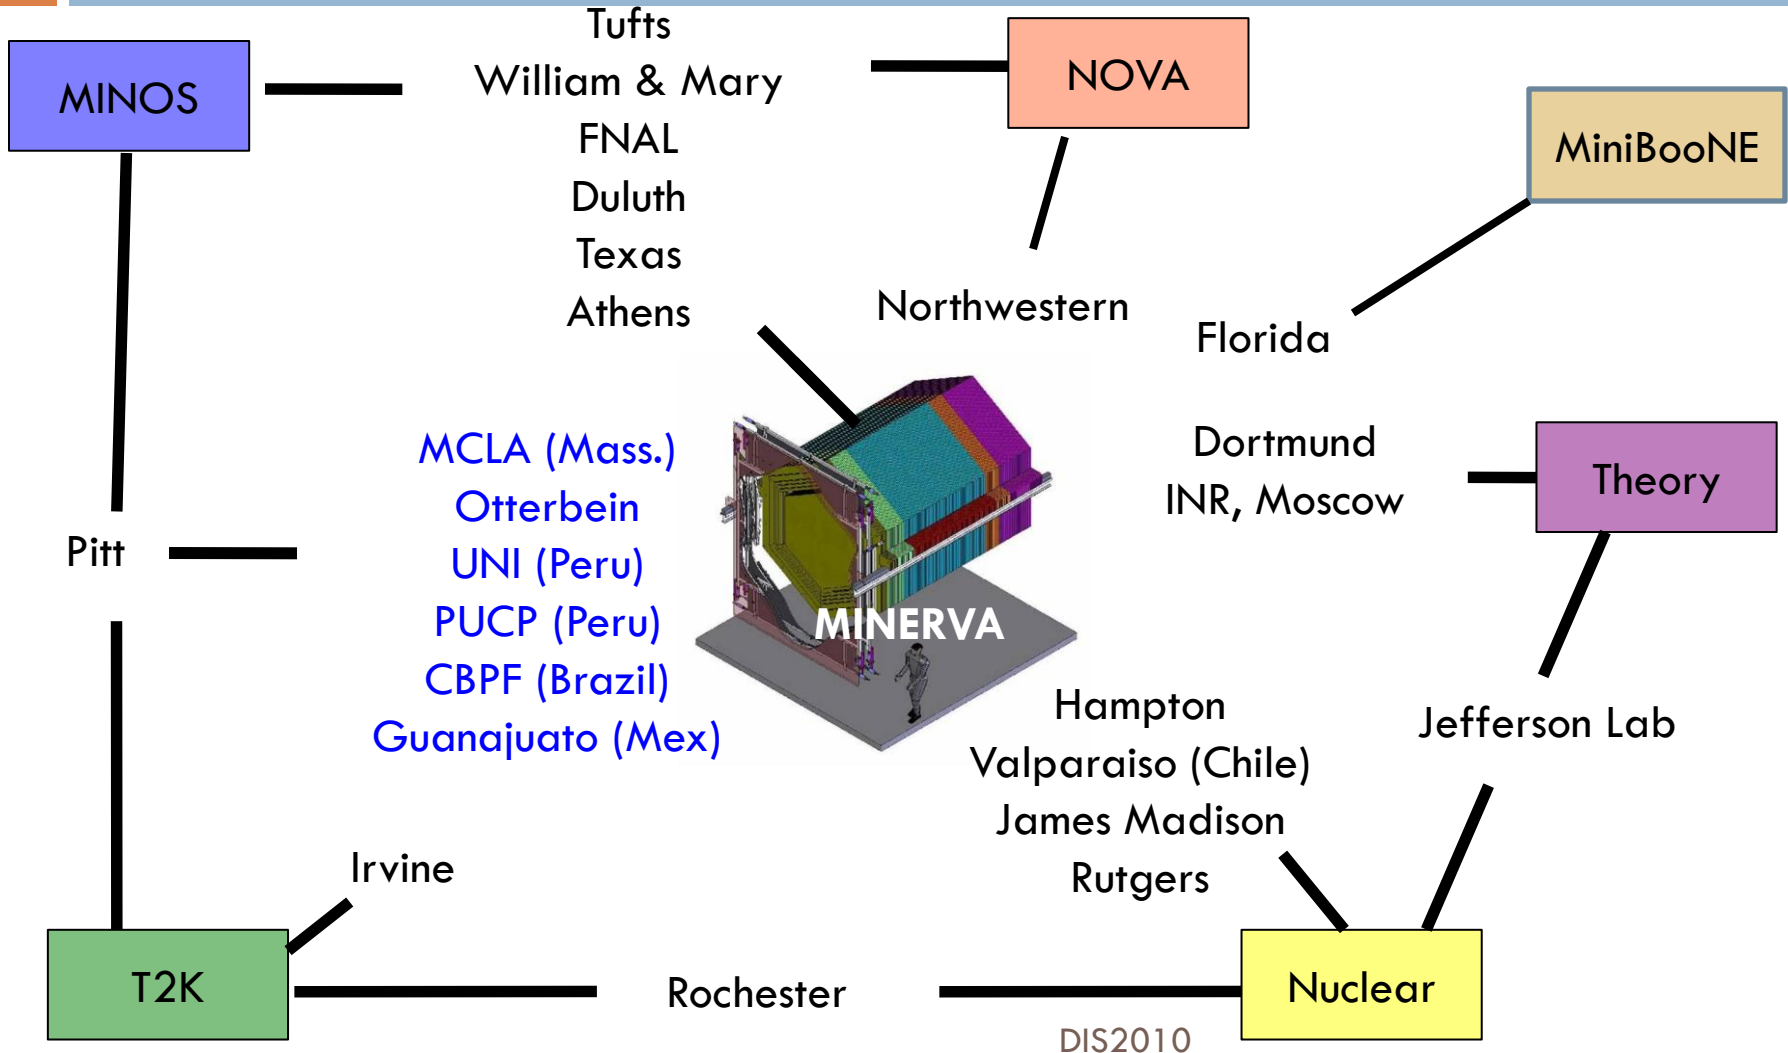

CC Process Type (on scint.)	Number of Events
Quasi-elastic	0.8M
Resonance Production	1.7M
Res-DIS Transition Region	2.1M
DIS Low Q <sup>2</sup> & Structure Functions	4.3M
Coherent Pion	89k CC, 44k NC
Charm/Strange	230k

Nuclear Target	Fiducial mass, tons	Number of Events
Helium	0.25	0.6M
Scint.	3	8.6M
Carbon	0.6	1.4M
Iron	1	2.9M
Lead	1	2.9M
DIS2010 Water	0.3	0.7M

## Institutions

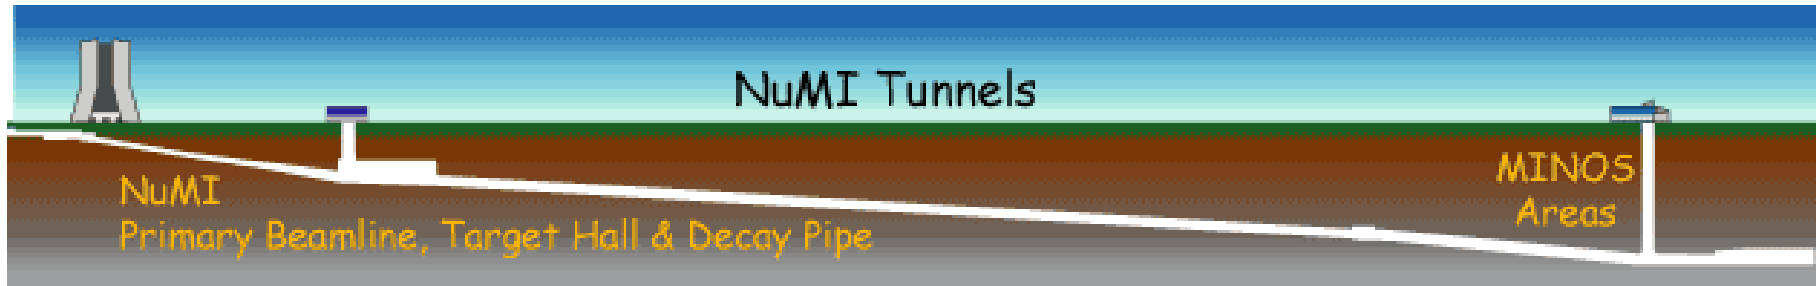

6

7

DIS2010

MINERvA

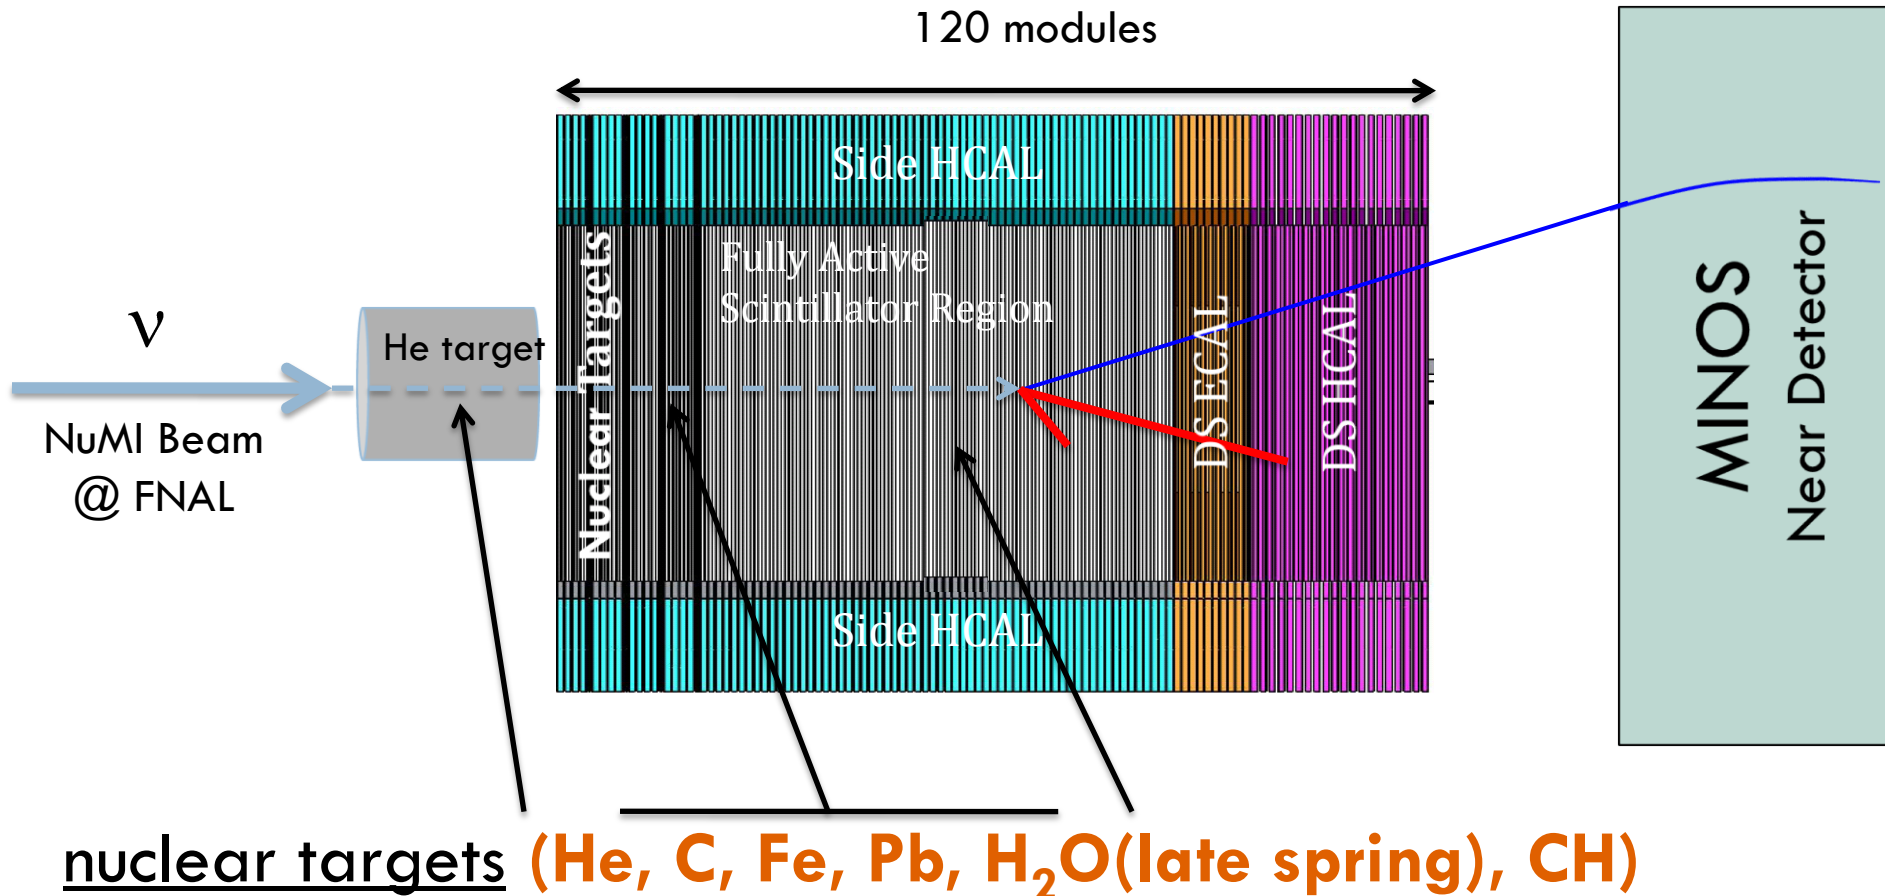

MINOS

# MINERvA

8

Finely segmented, fully active scintillator tracking region surrounded by ECAL and HCAL, ~32,000 channels

# Tracking prototype Spring 2009

9

# Tracking Prototype in NuMI

10

- 24 module tracking prototype ran in the NuMI Beam March 16 – June 12

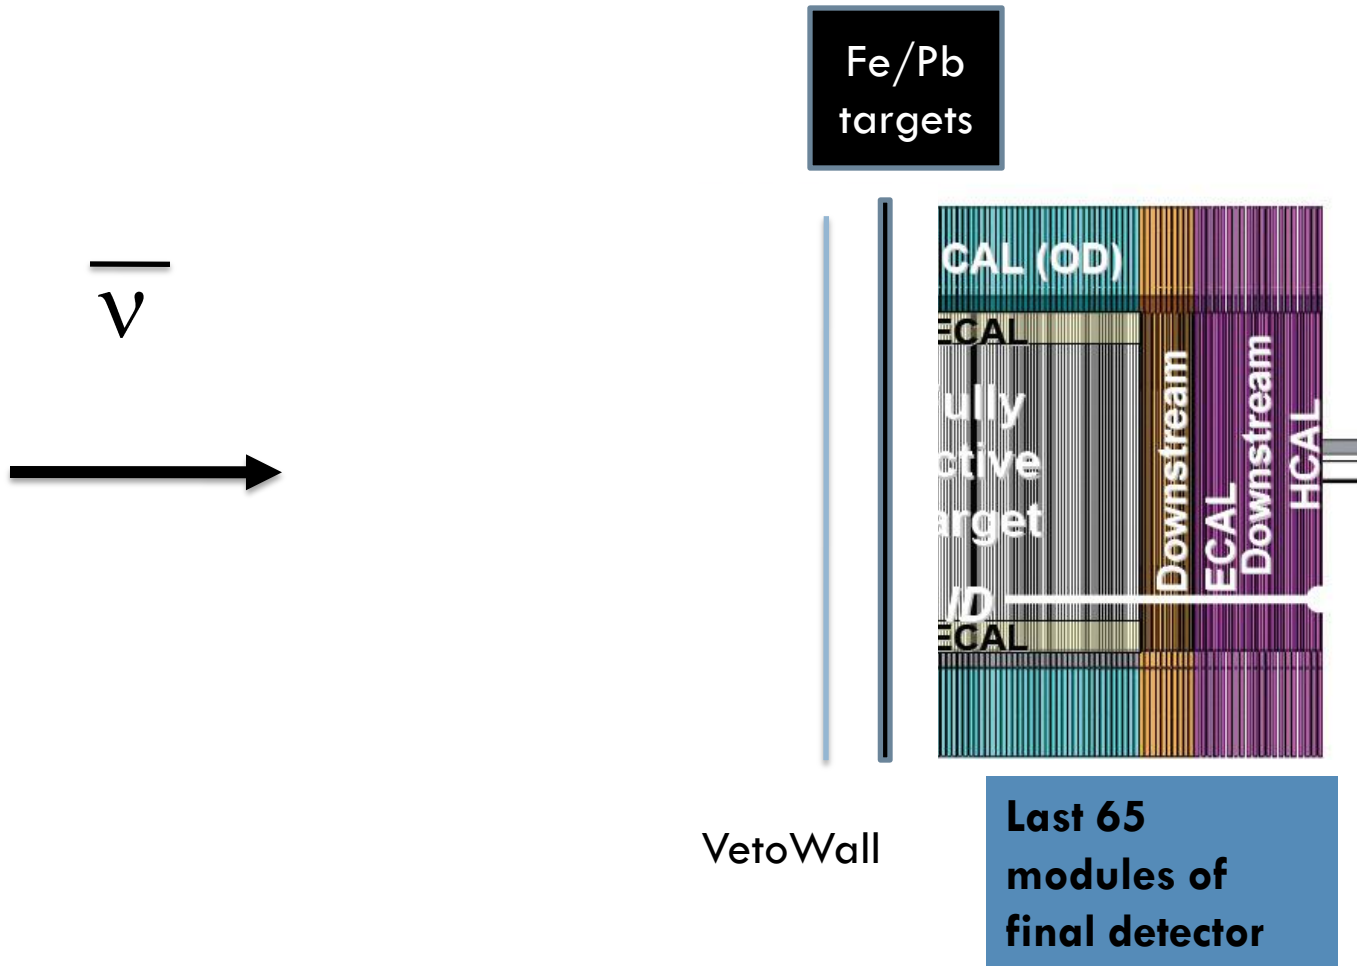

Process Type	% of Total (MC)
Safe DIS	32
Low Q DIS	9.5
Transition	31
Delta	12
Quasi-Elastic	15
Coh. Pi Prod.	0.5

DIS2010

# Partial Detector Winter 2009-10

11

# Present MINERvA Experimental Set-up

12

All Modules installed  
Veto wall and liquid target  
will be added in Fall 2010

**Side HCAL: 116 tons**

**Side ECAL Pb: 0.6 tons**

**DS ECAL:  
15 tons**

**DS HCAL:  
30 tons**

VetoWall

**Nuclear  
Targets:  
6.2 tons  
(40% scint.)**

**Fully  
Active  
Target:  
8.3 tons**

Added a water target!!

2010  
DPF09

# Done!

# MINERvA Detector Module

14

Outer Detector (OD)  
Layers of iron/scintillator for hadron calorimetry. 6 "Towers"

- ❖ A frame with two planes has 302 channels
  - ❖ 254 in inner detector
  - ❖ 48 in outer detector (two per slot)
- ❖ 4-5 M-64 PMTs per module
  - ❖ OD readout ganged in groups of four planes

Lead Sheets for EM calorimetry

136.00[3454.4]  
**162 in**

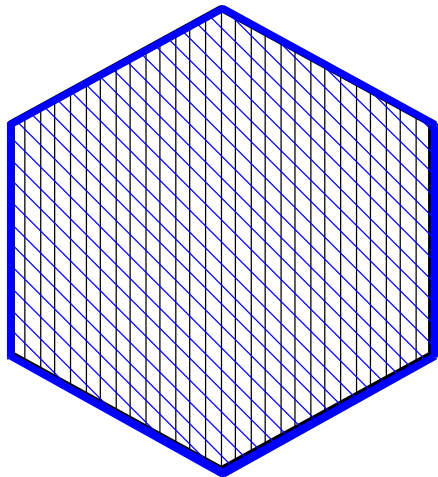

Inner Detector (ID)  
Hexagonal X, U, V planes for 3D tracking

# Inner detector

15

- 127 scintillating strips per plane, read out by wavelength-shifting (WLS) fibers.
- Alternating triangle design improves position resolution.

UX

VX

- Three different plane orientations  $\pm 60$  degrees
- Two planes (UX or VX) make a module
- Full detector has 114 modules, 6 nuclear target modules, and  $\sim 31$ k channels

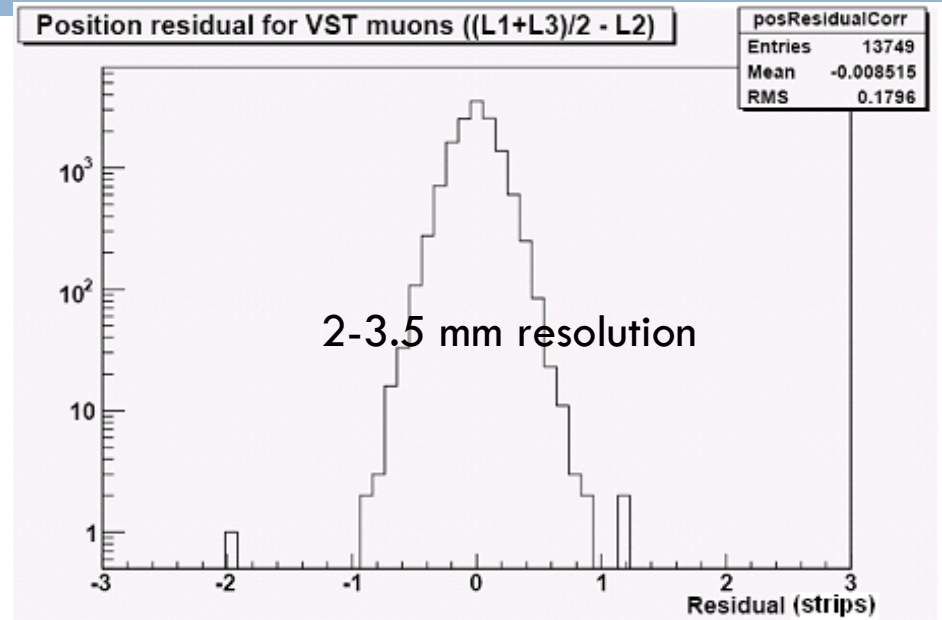

# Scintillating strips in ID

17 mm fiber to fiber

127 strips/plane

- Response is measured with a dedicated mapper before installation underground.

# Inner Detector Plane Fabrication at Hampton, William + Mary and Fermilab

1)

1) Scintillator Bars are cut and formed into planks

2) Planks are joined together to make hexagonal plane

3) Planes are instrumented with fibers and connector

4) Plane is made light tight

3)

2)

4)

DIS2010

# Module Construction

# LAST PLANE 3/15/10

# Data taking

21

- Prototype run with 24 modules
  - ▣ April-June 2009
  - ▣ 1.2 M beam gates (1 gate every  $\sim 2$  seconds)
- Anti-neutrino run with 65 modules
  - ▣ November 2009 – March 2010
  - ▣ 3.3M beam gates
- Neutrino run with 120 modules
  - ▣ March 2010 ....
  - ▣ 0.7M beam gates so far...

Neutrino scattering rate in the full fiducial volume is expected to be around 0.07 events/beam gate.

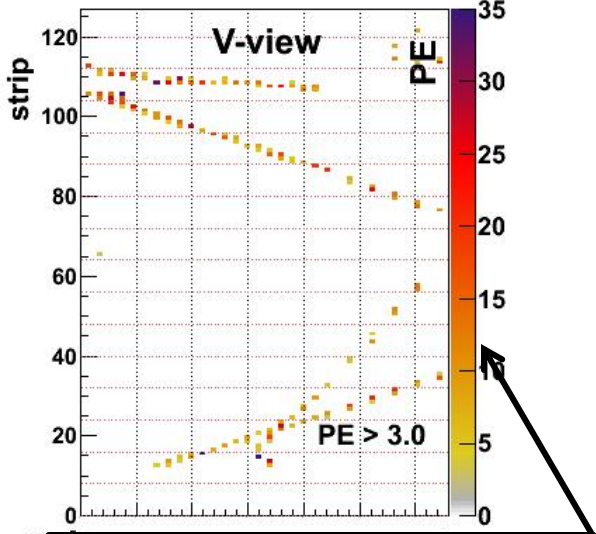

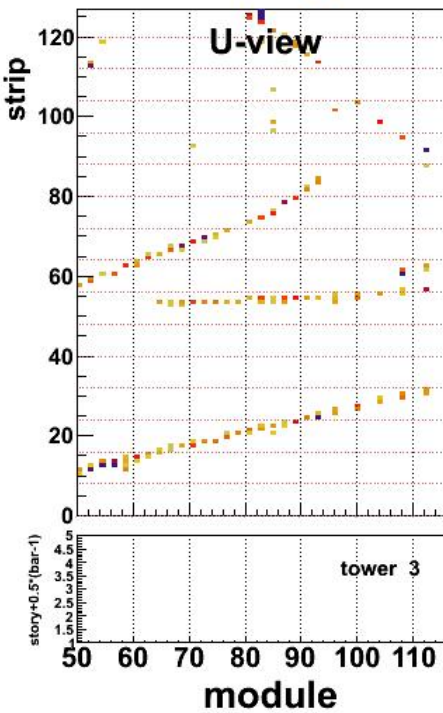

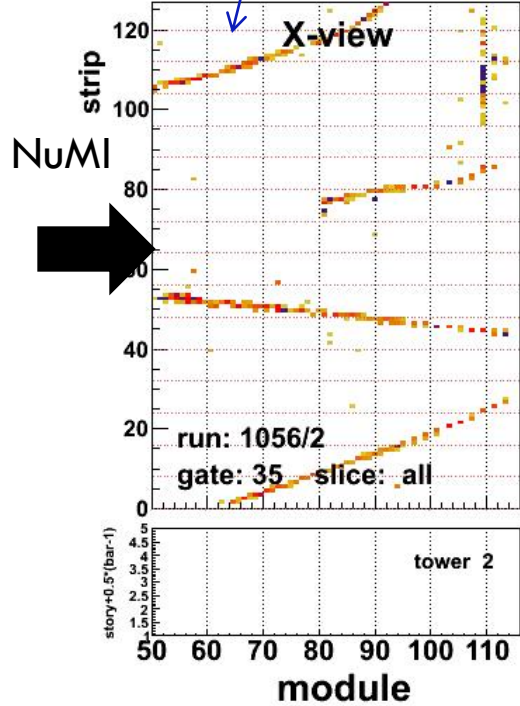

# Event gallery

22

- Rock muons for calibration
- Quasi-elastic  $\nu n \rightarrow \mu p$ ?
- Elastic  $\nu p \rightarrow \nu p$
- Pions and electrons
- DIS nightmares

# Rock Muons – most common

23

Energy deposit in PE  
 Typical muon is 10-15 PE  
 ie. muons are Orange

- Muons created by upstream neutrino interactions
- Valuable absolute energy calibration tool

# Events: Quasi-elastic Candidates

24

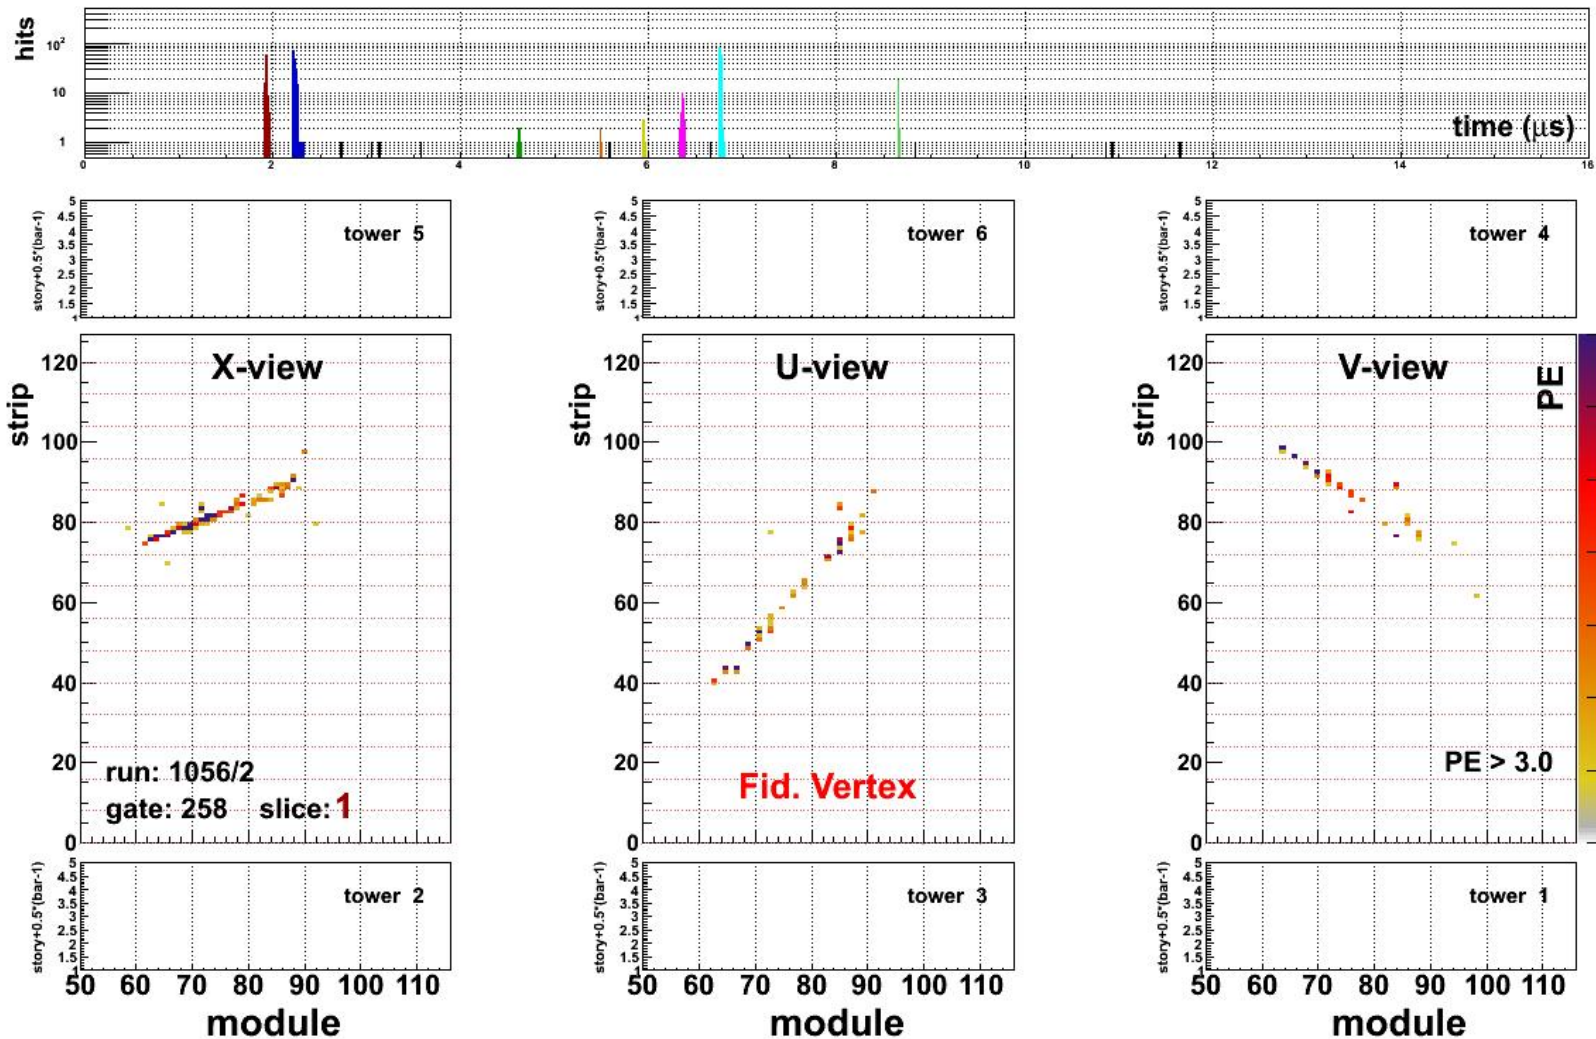

Muon kinematics from angle, range and momentum in MINOS.

Proton kinematics from angle, range.

Pattern recognition not fully automatic yet. (muons easy, short active volume makes interacting particles harder to track.)

# Elastic NC proton candidate?

25

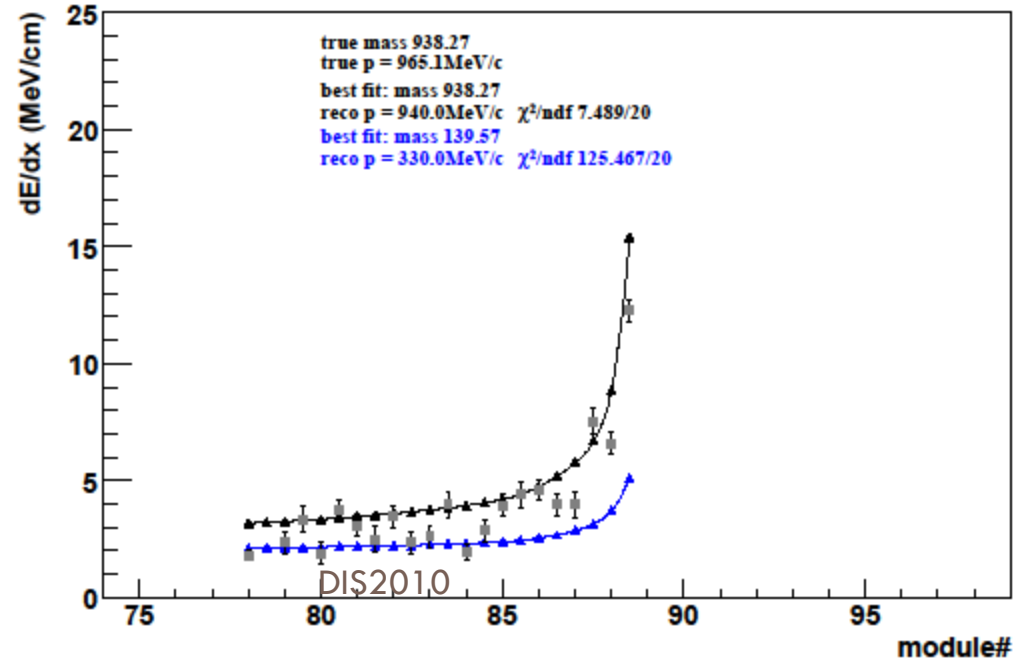

# Particle ID by dE/dx : GENIE Simulation

dE/dx Profile for a simulated proton

Contained proton prong

# Particle ID by dE/dx : GENIE Simulation

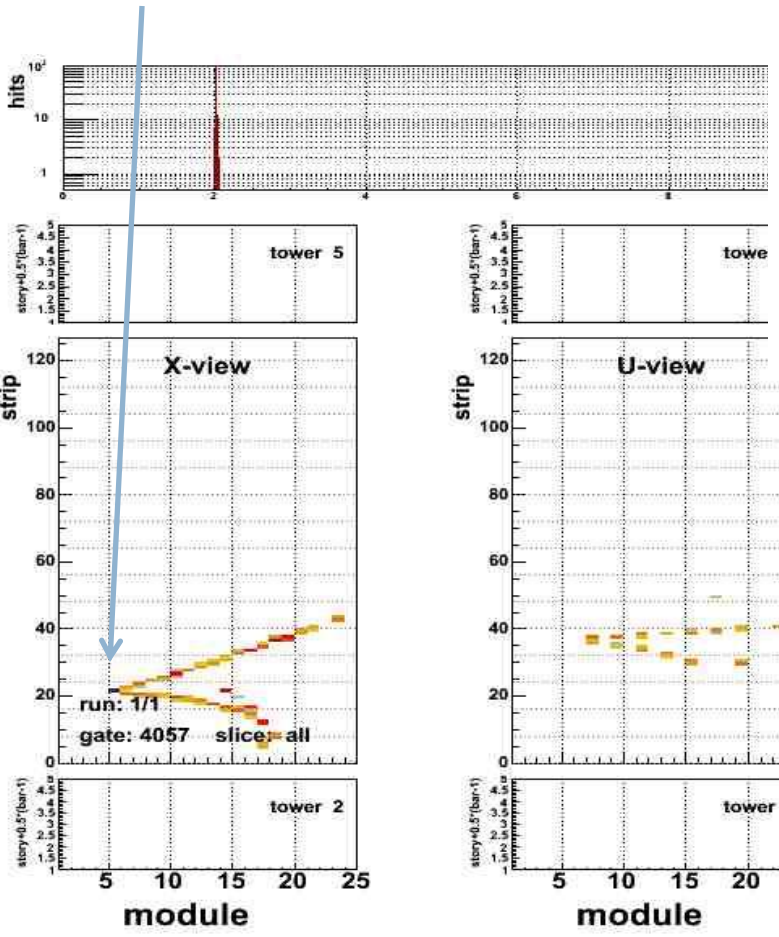

$$\nu_{\mu} + n \rightarrow \mu^{-} + n + \pi^{+}$$

27

dE/dx Profile for a simulated pion

Heavy ionizing vertex

Contained pion prong

# hits Particle ID: TP data

## Neutral Current Quasi-Elastic Candidate

**dE/dx Profile Run576 Gate673 Timeslice4**

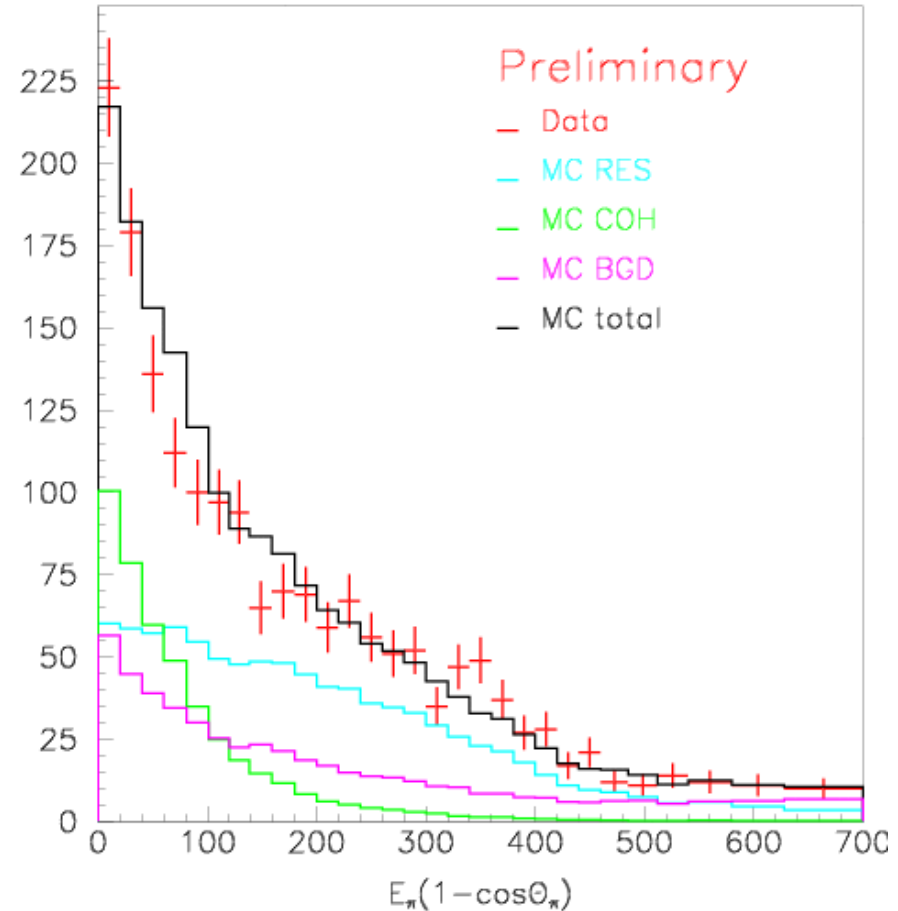

# Low energy inclusive and exclusive cross sections

30

MiniBoone Coherent  $\pi^0$  measurement

- $\pi^0$  NC important for oscillation experiments

DIS2010

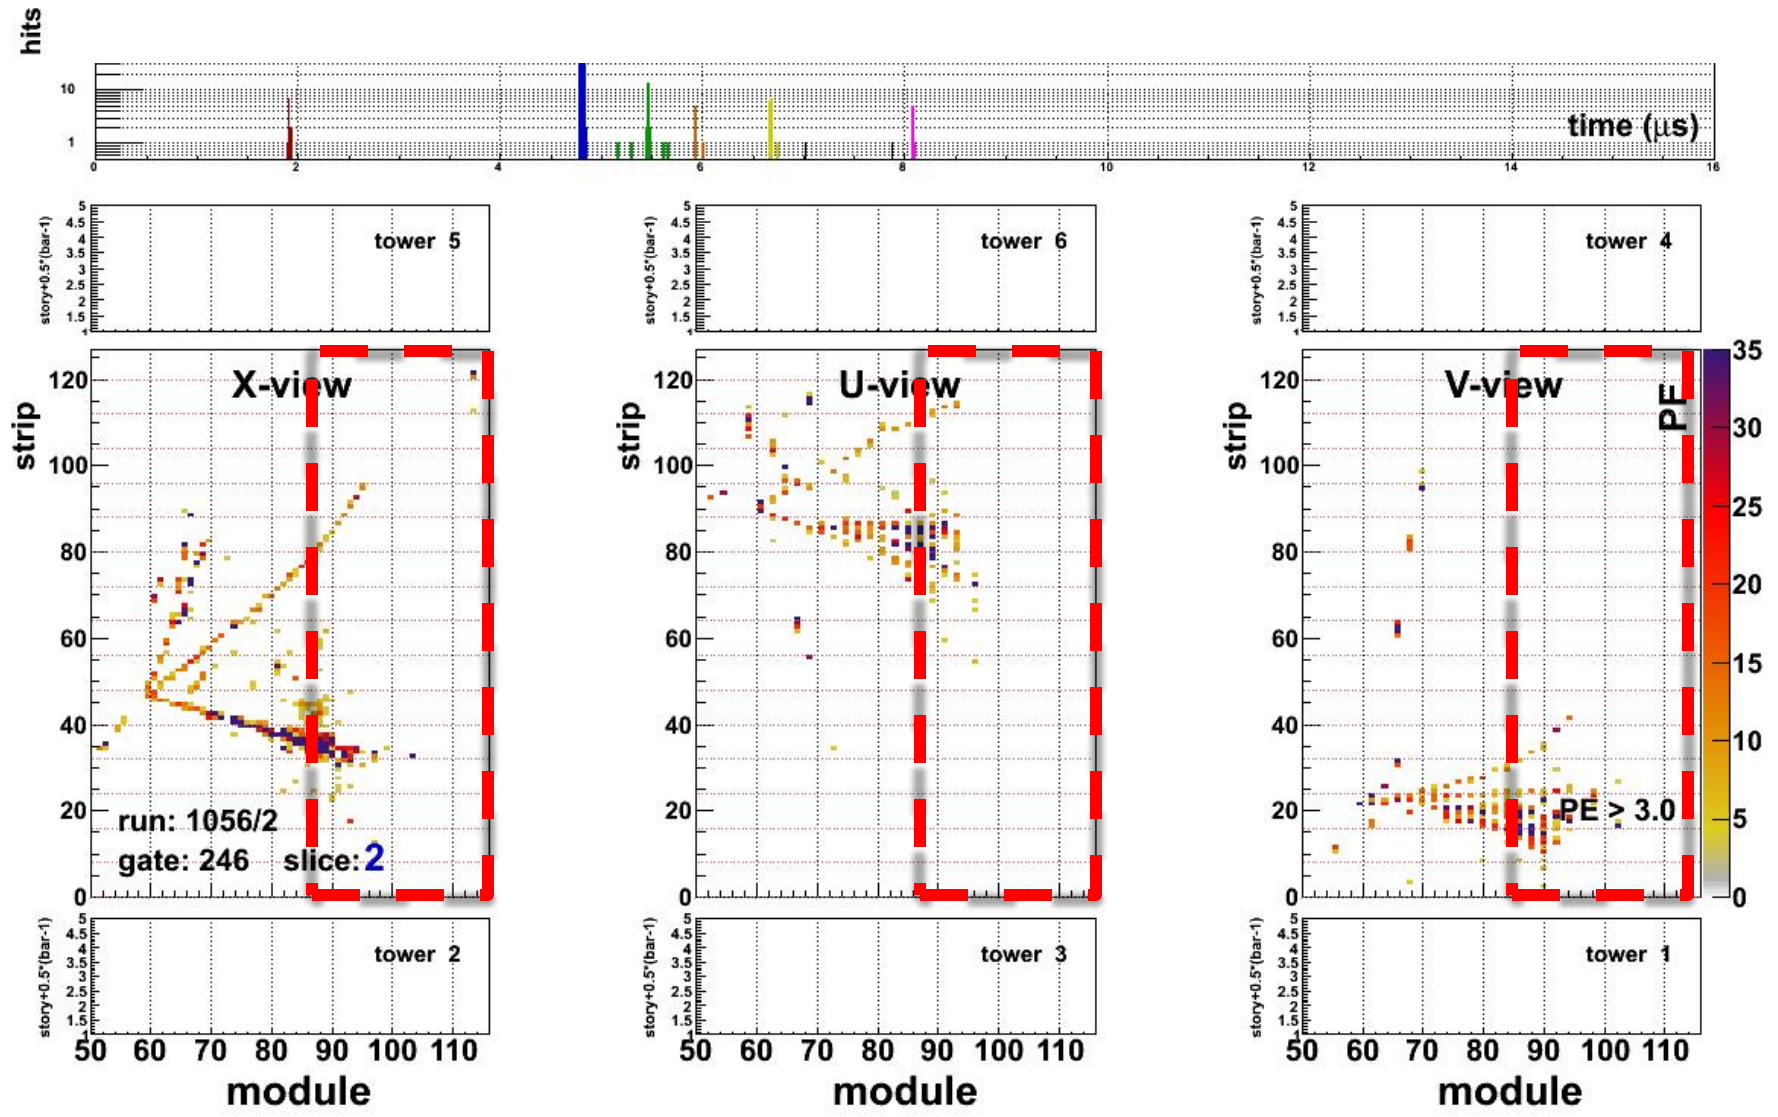

# Events: $\pi^0$ Candidate

1

$$\pi^0 \rightarrow \gamma\gamma \quad \gamma \rightarrow e^+e^-$$

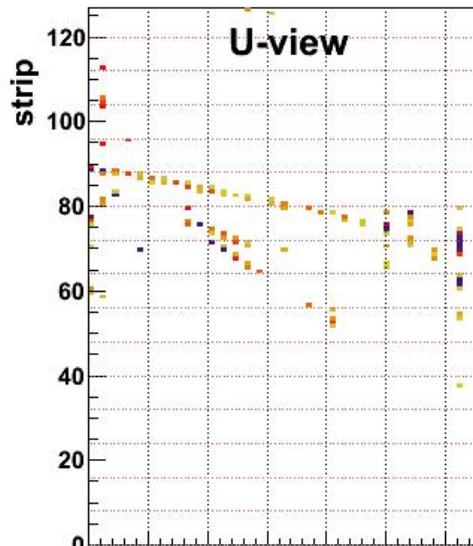

# Event with EM shower $\pi^0$ or electron?

# $\pi^0$ conversion candidate in the tracker

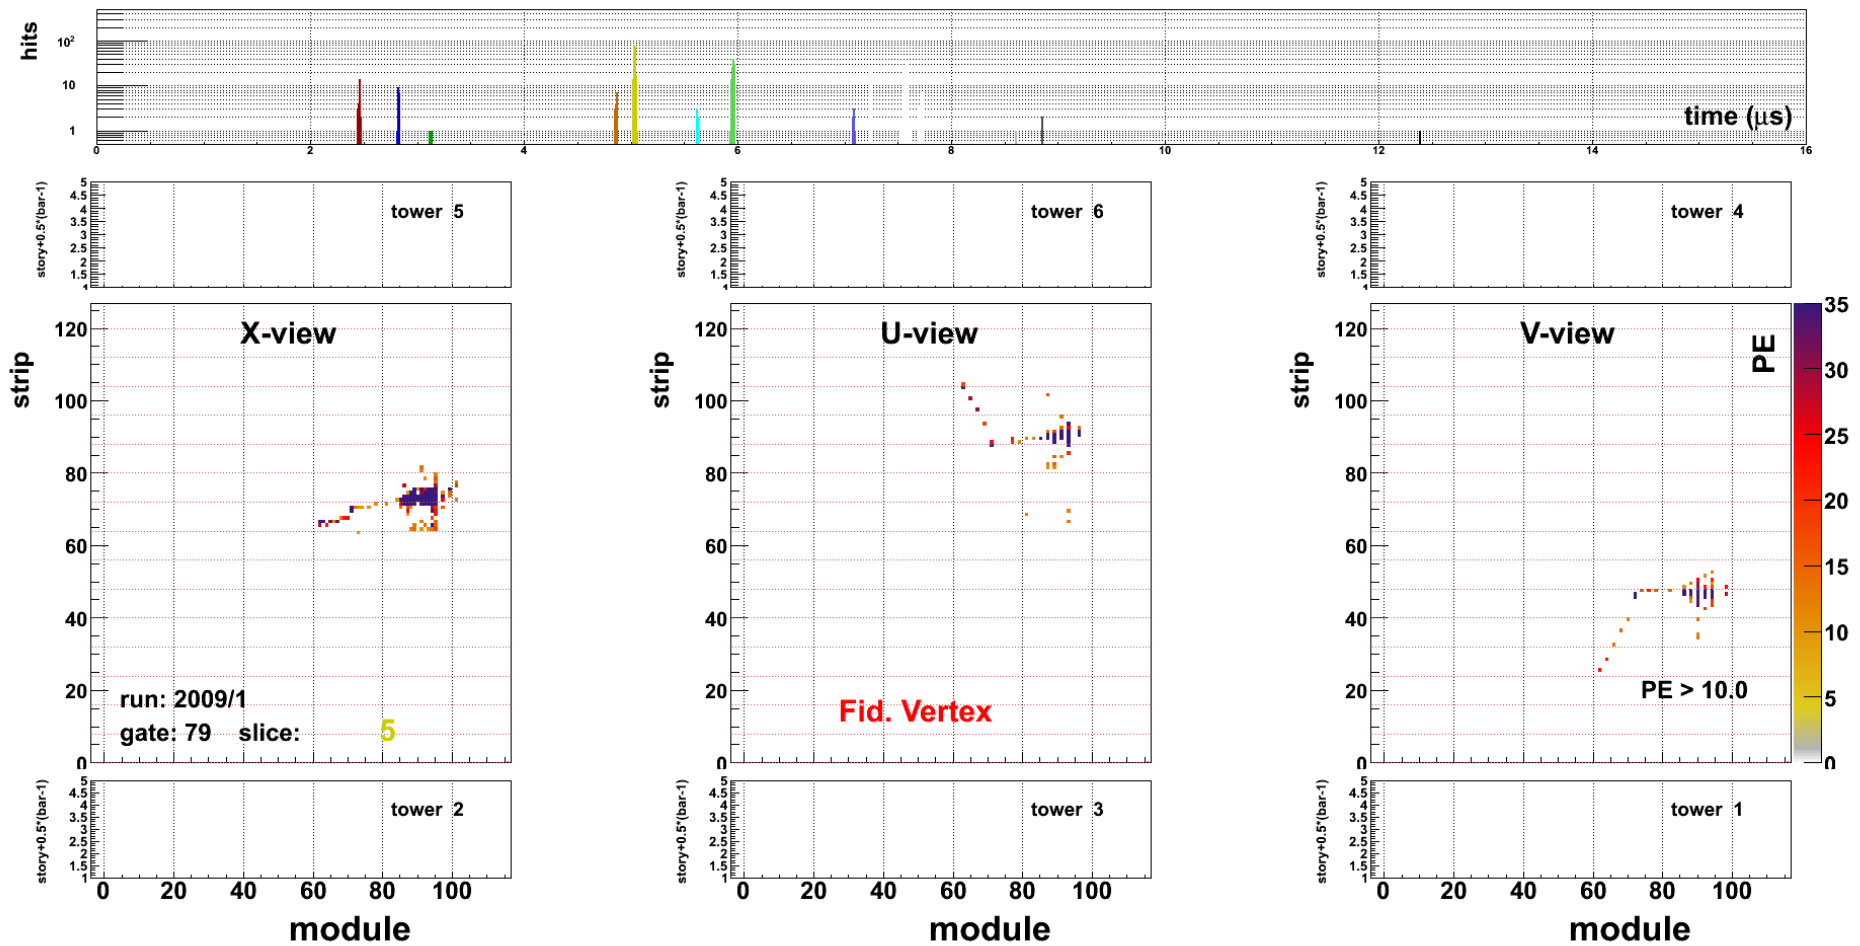

33

# Event with EM shower in ECAL (candidate $\nu_e$ ?)

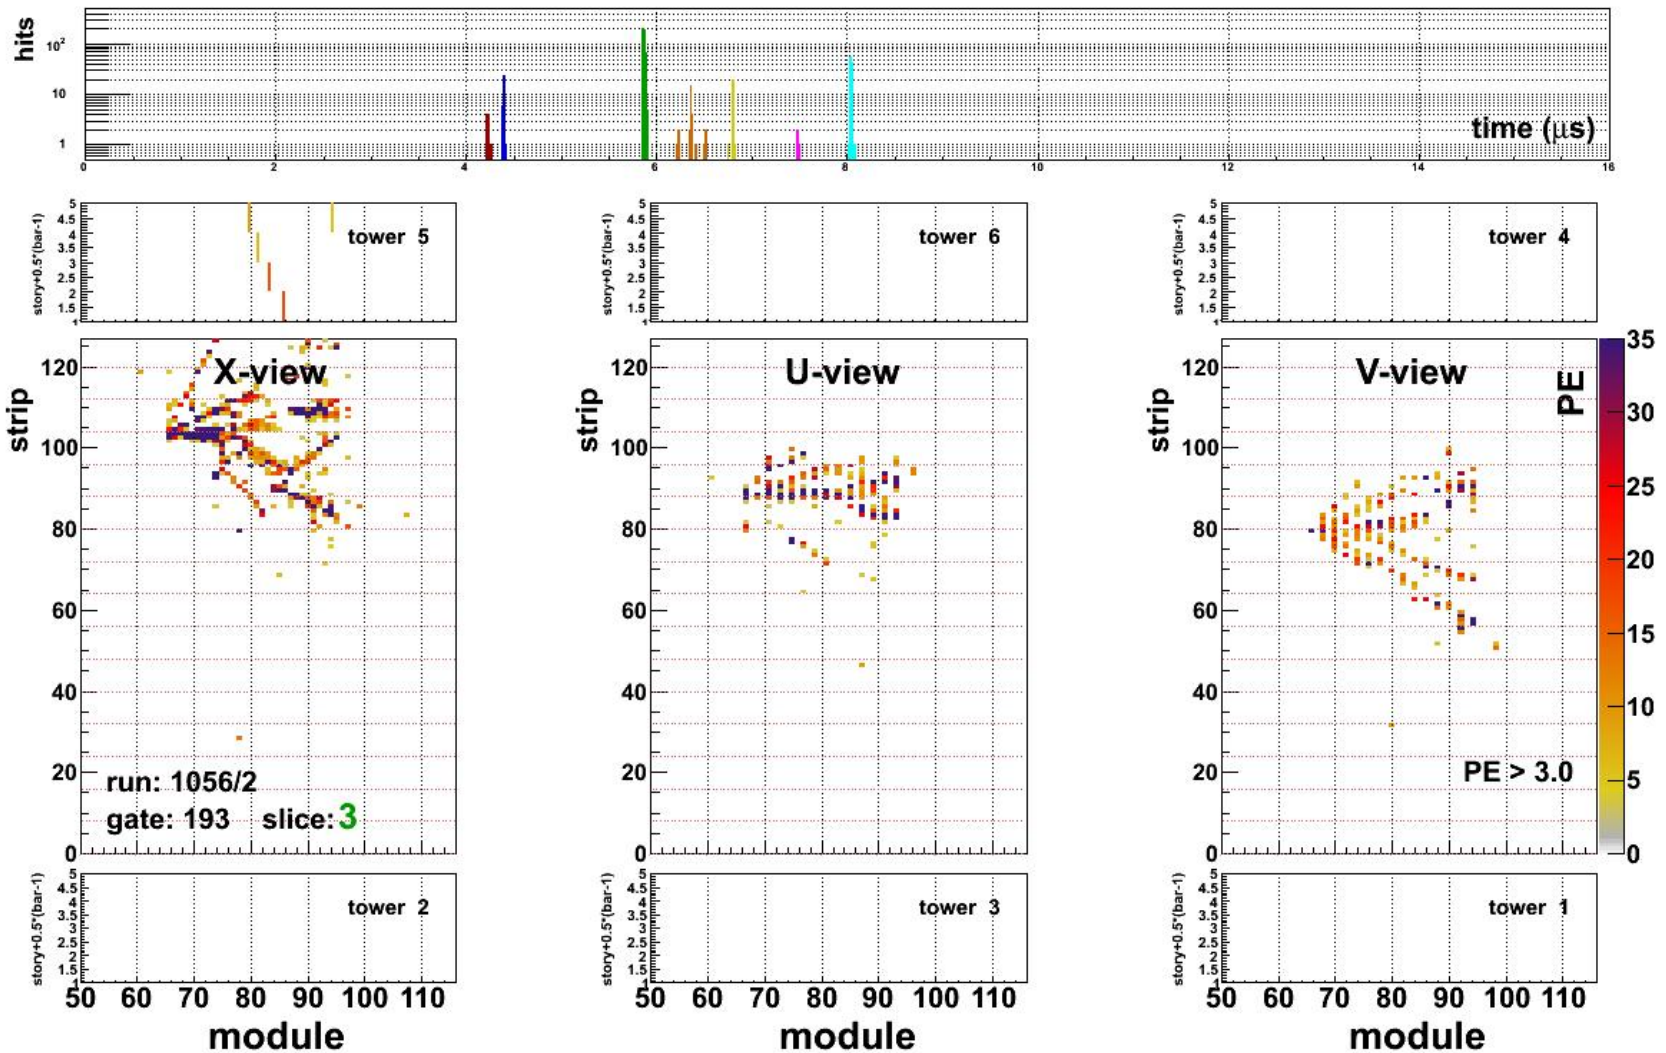

34

□ And a backwards going track

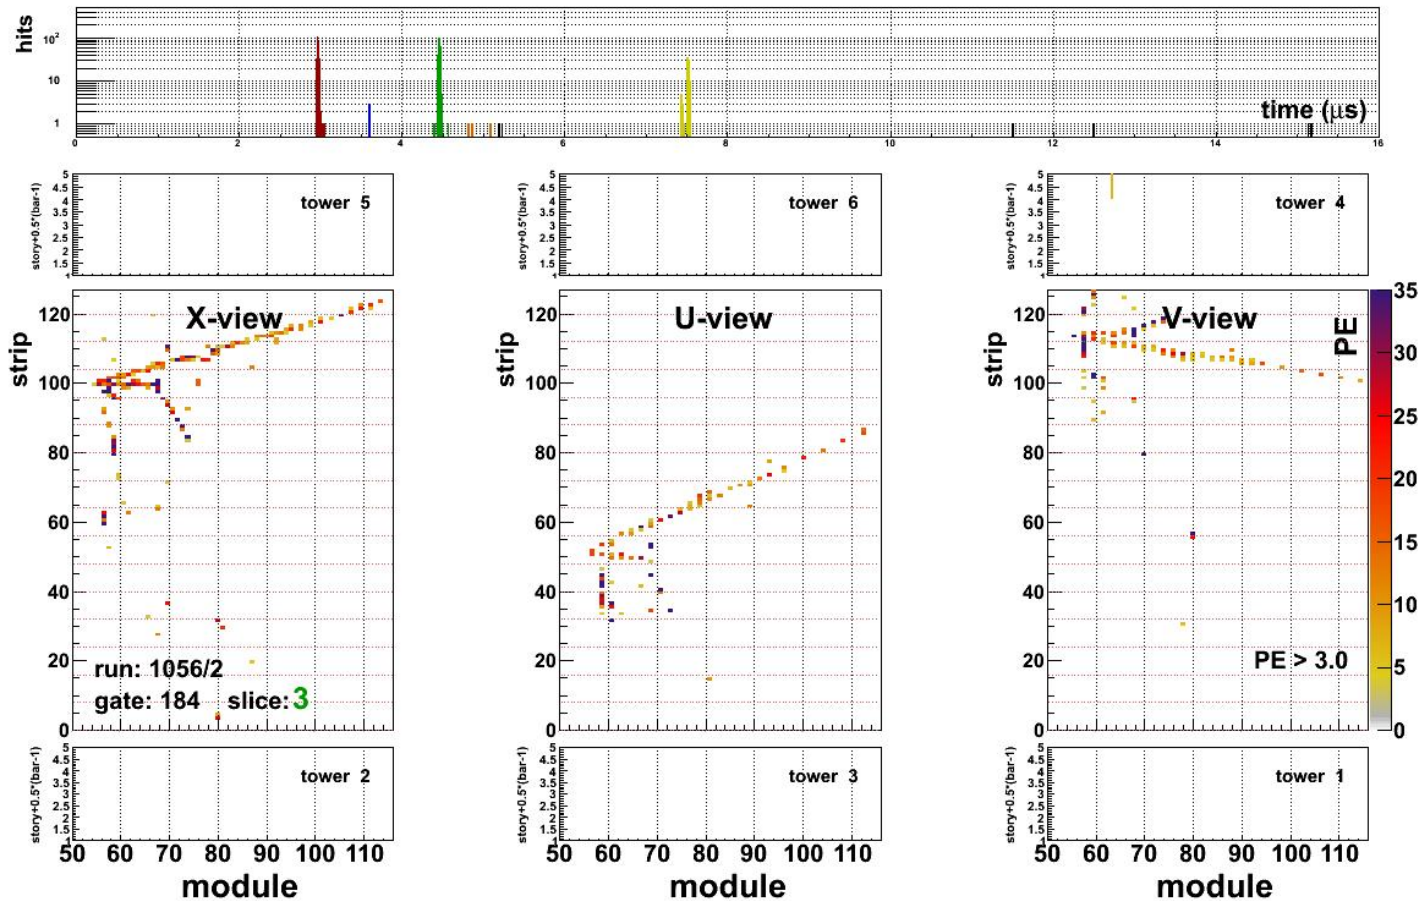

# Complex interaction

35

# Secondary interaction in tracker

36

# What can you expect for DIS2016?

37

- Take data with Low Energy beam 2010-2012 4E20 Pot
- Take data with Medium Energy beam 2013-... 12E20 Pot
- Expected numbers of events in  $(x, Q^2)$  for 4-6 years of running in the Resonant  $\rightarrow$  DIS transition region
- Study transition between perturbative and nonperturbative QCD regimes
- High statistics at high  $x$

# Deep Inelastic Scattering Physics: PDFs and Nuclear Effects

arXiv:0907.2357v2 [hep-ph]

38

## Electron and muon scattering

- Red curve is a pdf fit with A dependent coeff.

## Neutrino scattering (NuTeV Fe)

- Red curve uses same method but gets different coeff.

# So what?

39

- Much of our information on the anti-quark content of the proton comes from neutrino experiments on Iron.
- We don't know much because we don't understand how to correct  $Fe \rightarrow p$
- Precision of LHC measurements (Tevatron less affected) depends on doing this right.
- Minerva can measure the  $A$  dependence of the inclusive structure functions and, possibly, test mechanisms by looking at final state differences.

# Current and Future Plans

40

- We have completed a 4 month run in  $\nu_{\mu}$ -bar mode with 60% of the detector.
- We have started reconstruction of those data.
- Installation of the full detector was completed in March 2010.
- We are now taking data with  $\nu_{\mu}$  beam with the full detector.

# Conclusions

41

- MINERvA is designed to study neutrino interactions in great detail and to support current and future neutrino oscillation experiments.
- An early look at the data after a run with 60% of the detector shows that the detector works very well. **We can distinguish different particle species!** We are using these events to tune our calibration and reconstruction algorithms.
- MINERvA is on its way
- Stay tuned for cross section and exclusive measurements at the next DIS!

# BACKUP SLIDES

42

# Neutrino Flux Estimates from MINOS

43

Sacha Kopp – report 9/19/2008

# Comparisons with MINOS/NA49 data

44

# Electronics

45

- Light measured by Hamamatsu **64 anode PMTs** (newer version of MINOS model)
- **Front end board** (FEB) with Trip-t chips interface the PMTs
- **Discriminators** allow us to trigger at 1PE and resolve overlapping events during a spill

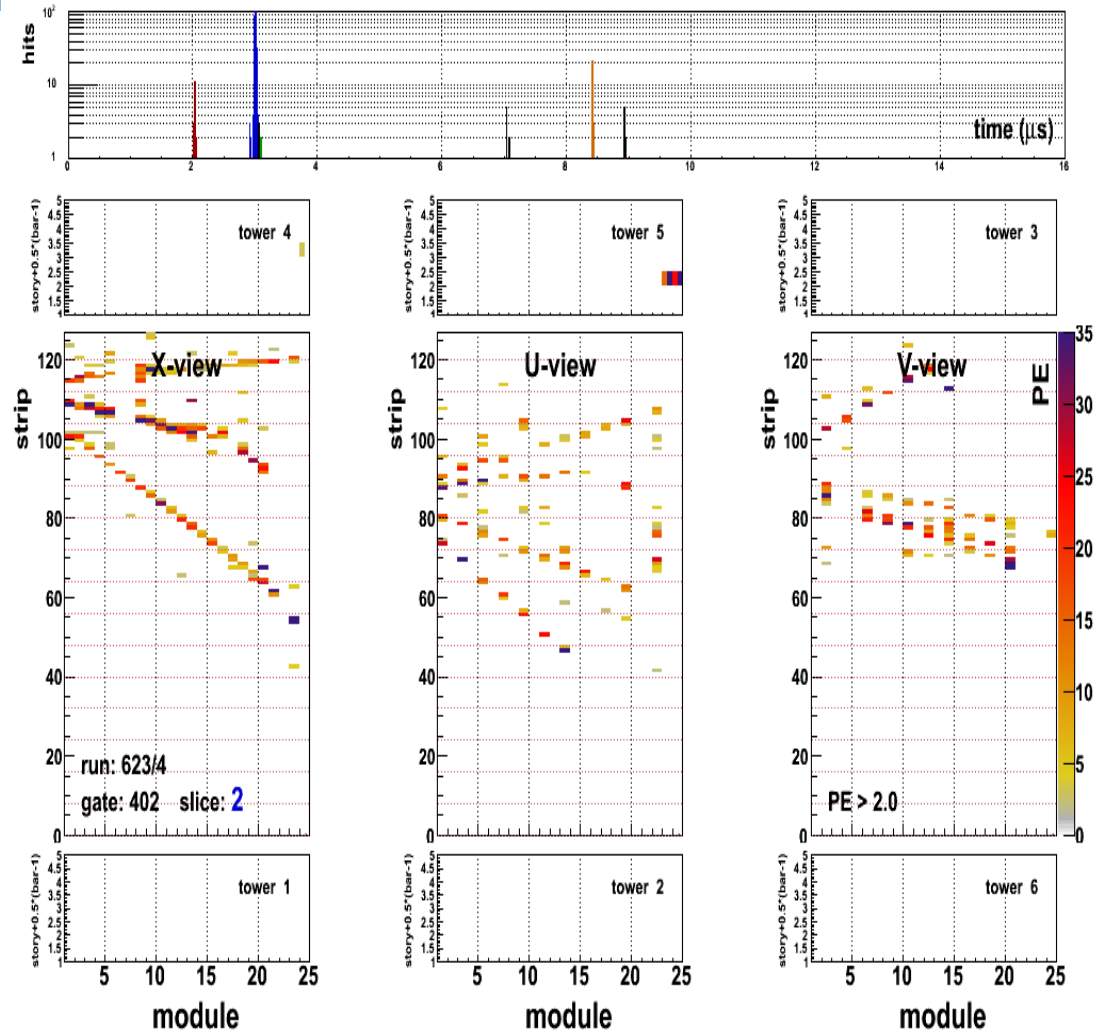

# Physics: Nuclear Effects

46

- Study effects of Fermi motion
- Test the dipole form of the axial form factor and study structure functions and pdfs
- Study A dependence of various processes
- Measure hadron spectrum and multiplicity
- Examine final state interactions within the nucleus

# Nuclear Targets

47

Red = Iron, Grey = Lead, Black = Carbon

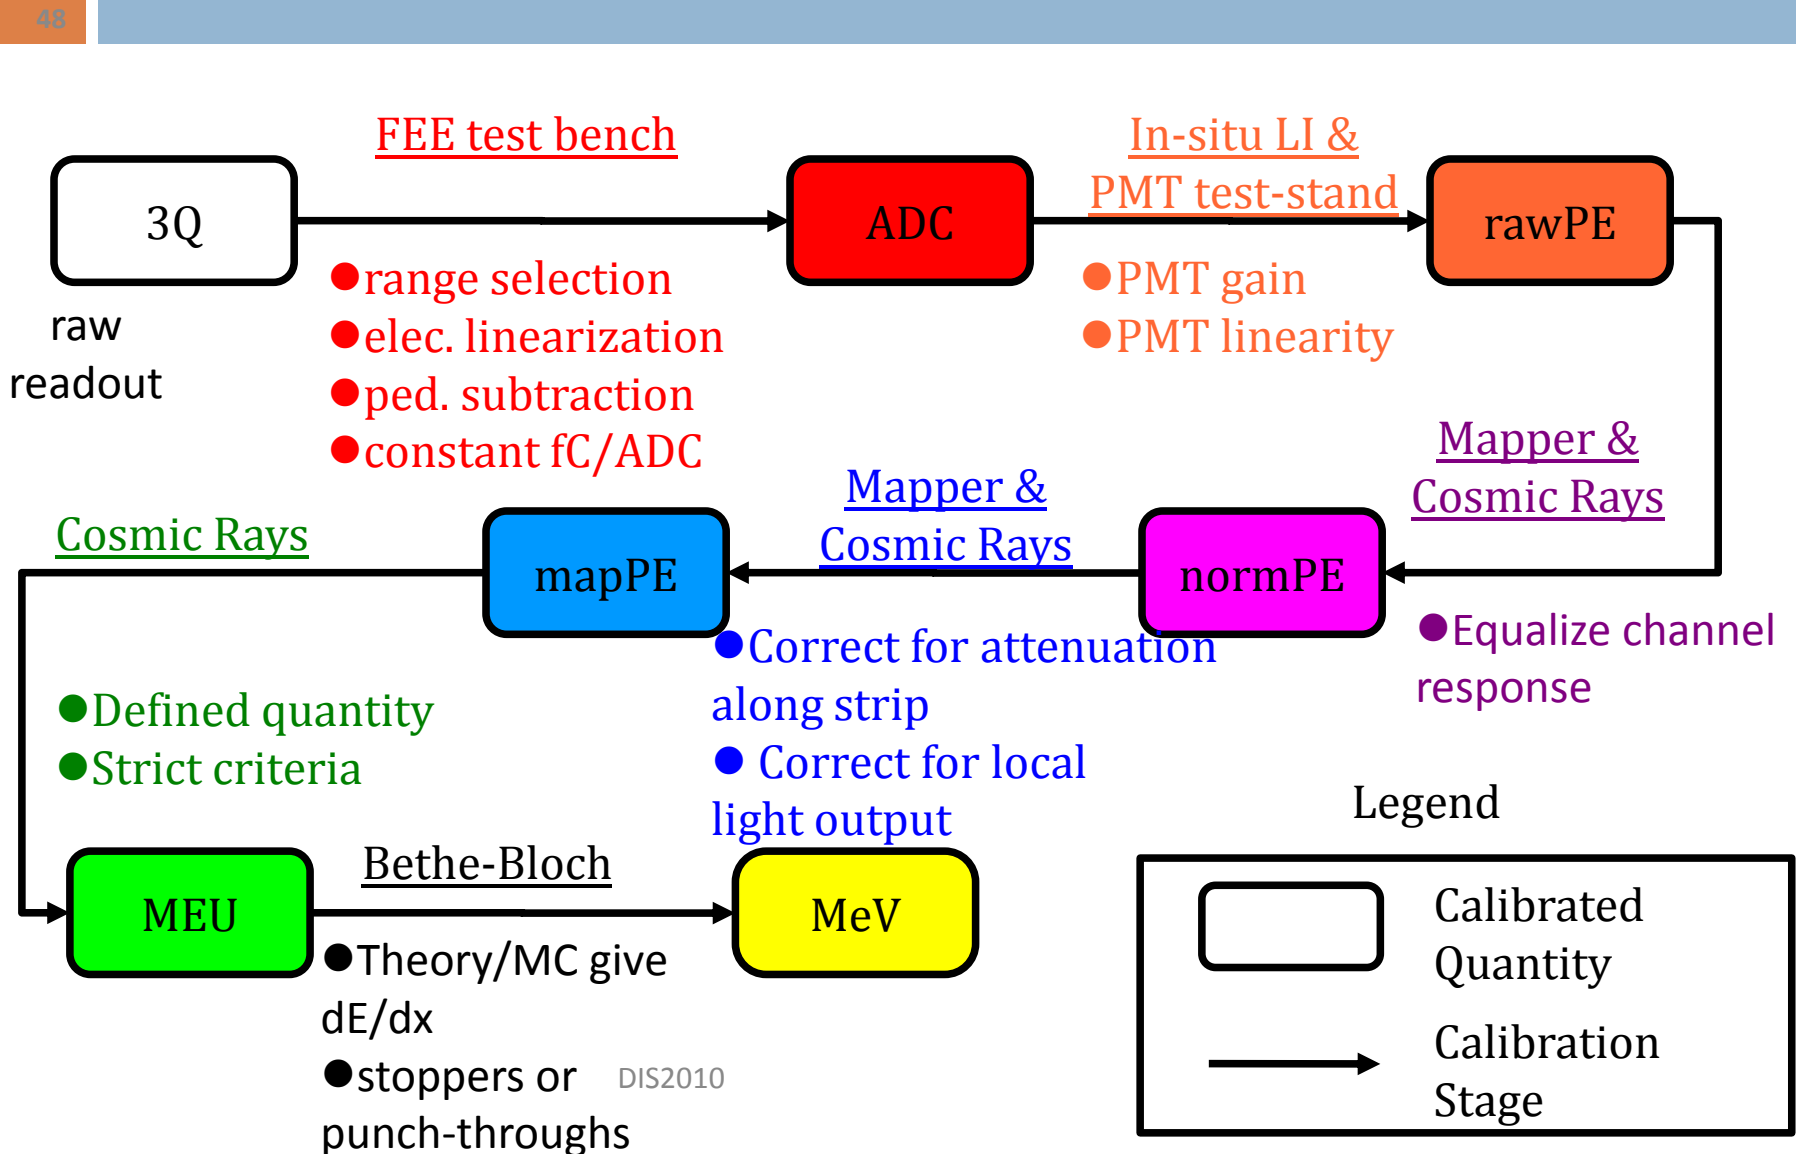

First two targets: High statistics, compare lead and iron

Third target: Compare lead, iron, and carbon with same detector geometry

Last targets: Thin for low energy particle emission studies, high photon detection

$^4\text{He}$  cryogenic target in front of detector

# Calibration Chain

# Detector Performance

49

- Kinetic energy needed to cross 5 modules (10 planes)
  - $p > 175 \text{ MeV}$ ,  $\pi^{+/-} > 85 \text{ MeV}$ ,  $\mu > 70 \text{ MeV}$
  - EM shower:  $e, \gamma > 50\text{-}60 \text{ MeV}$
- Particle ID
  - $dE/dx$  – For tracks stopping in plastic,  
expect correct ID  $\sim 85\%$  K,  $90\%$   $\pi^{+/-}$ ,  $> 95\%$  p
- Muon Reconstruction
  - 85-90% of muons stop in MINERvA or MINOS
  - Above 2 GeV majority in MINOS
  - $\delta p/p \sim 5\%$  stoppers, 10-15% via curvature

# Vertical Slice Test

50

- Position resolution of 2.5mm
- Distance between center of strips is 1.7cm

# Physics: More Quasi-elasticics

51

Plot of expected MINERvA **quasi-elastic cross section** result, with statistical errors including **purity** and **efficiency**

# Physics: Coherent Pion $\sigma$

52

## CC Coherent Pion Production Cross Section

MINERvA's nuclear targets allow the first measurement of the **A-dependence** of  $\sigma_{\text{coh}}$  across a wide A range

# Physics: Form Factors

53

- There is a discrepancy in the measured value for the **axial mass** from older experiments (mostly on  $D_2$ ) and more recent experiments (on heavier nuclei)
  - MINERvA, with its range of nuclear targets, will provide much more data that can help to resolve this question
- With high  $Q^2$  range from NuMI, MINERvA will also test the assumed dipole form of  $F_A$

$$F_A = \frac{1.267}{1 + \frac{Q^2}{M_A^2}}$$

## K2K SciFi (16O, $Q^2 > 0.2$ )

Phys. Rev. D74, 052002 (2006)

$$M_A = 1.20 \pm 0.12 \text{ GeV}$$

## • K2K SciBar (12C, $Q^2 > 0.2$ )

AIP Conf. Proc. 967, 117 (2007)

$$M_A = 1.14 \pm 0.11 \text{ GeV}$$

## • MiniBooNE (12C, $Q^2 > 0$ )

paper in preparation

$$M_A = 1.35 \pm 0.17 \text{ GeV}$$

## • MINOS (Fe, $Q^2 > 0.3$ )

NuInt09, preliminary

$$M_A = 1.26 \pm 0.17 \text{ GeV}$$

Argonne (1969)  
 Argonne (1973)  
 CERN (1977)  
 Argonne (1977)  
 CERN (1979)  
 BNL (1980)  
 BNL (1981)  
 Argonne (1982)  
 Fermilab (1983)  
 BNL (1986)  
 BNL (1987)  
 BNL (1990)  
 Average

$M_A$  (before 1990):  
 $1.03 \pm 0.02 \text{ GeV}$

$M_A$  (after 2000):  
 $\sim 1.2 \text{ GeV}$

What's going on?

# Calibrations: PMT Gains

54

- Gain measured by two methods: low photoelectron (PE) spectra fits and high PE Poisson statistics
  - Agreement to within **10%**
- Low PE fit method has a combined statistical and systematic error of  **$\sim 3-5\%$**
- Light injection (LI) box is calibration light source
  - Coming soon: Pin diode monitor

# Calibrations: Test Beam

- 55
- Reconfigurable Pb, Fe, and Scintillator modules to emulate different detector regions
  - 16 GeV pion beam creates tertiary beam of **300 MeV – 1.2 GeV**
  - Will provide the **hadronic response calibration**

Legend:

- 1: Pion Beam
- 3,10: Time of Flight Triggers
- 4,5,8,9: Wire Chambers
- 6: Magnets

# Tracking Prototype

56

- 24 full-sized MINERvA modules assembled into a detector (~20% of full detector)
  - 10 tracking modules
  - 10 ECAL modules
  - 4 HCAL modules
  - 1 prototype iron target
- Test stacking tolerances and interplay of many basic detector and readout components
- Built and Commissioned above ground **June 2008 – March 2009**
- Took **cosmic ray run** using veto wall as trigger (**32.6k** single track events)
