

MSADC to FMC adapter board, and FPGA firmware

Luis G. García O.

ICTP-MLAB/UNITS/INFN-TS
COMPASS-TS GROUP

COMPASS Front-End, Trigger and DAQ Workshop, 2-3 March 2020

Motivation

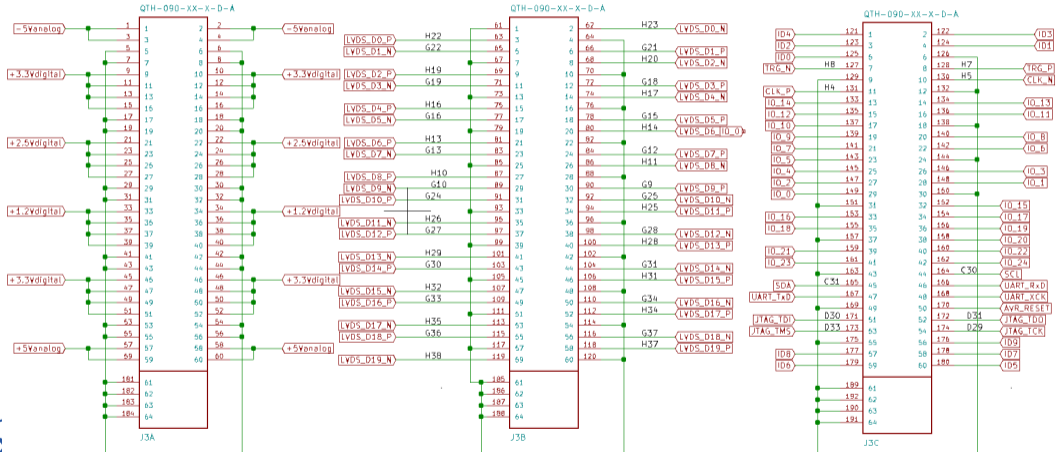

Moving towards a free running DAQ requires to adapt the original MSADC-FPGA design (ECAL2) to provide a continuous data stream from the analog channels. This fast MSADC readout should provide continuous data streams for experimentation on online feature extraction and data compression. An interposer board was designed to facilitate the communication between the MSADC board and multiple commercial FPGA-based carriers that use a standard FMC (ANSI/VITA 57.1) connector.

Features:

- 16 analog channels ADC board (12 bits, 80 MHz)
- 4 x TI ADS5270 (32 logic channels @ 40MHz)
- Virtex 4 FPGA
- QSH-90 High Speed connector
- 6 Voltage power domains.
 - $\pm 5V$ analog
 - +3V analog/digital
 - +1.2 V digital

QSH-90 Connector Pin Mapping

Features

- 9V @ 3A input voltage
- Full mapped QTH-090-04-F-D (Qstrip) Connector
- ASP-134602-01 ANSI/VITA 57.1 (FMC).
- Power supply for the MSADC Board in six voltage domains.
- JTAG chain programming through FMC connector.
- UART Tx/RX pins.

MSADC to FMC Carrier Examples

CIAA-ACC (Zynq 7030)

ZCU102 Board (Zynq Ultrascale+)

MSADC Firmware Modifications and Carrier Board development

32 digital channels @ 40 MHz or
16 analog channels @ 80 MHz

1 analog channel @ 80 MHz

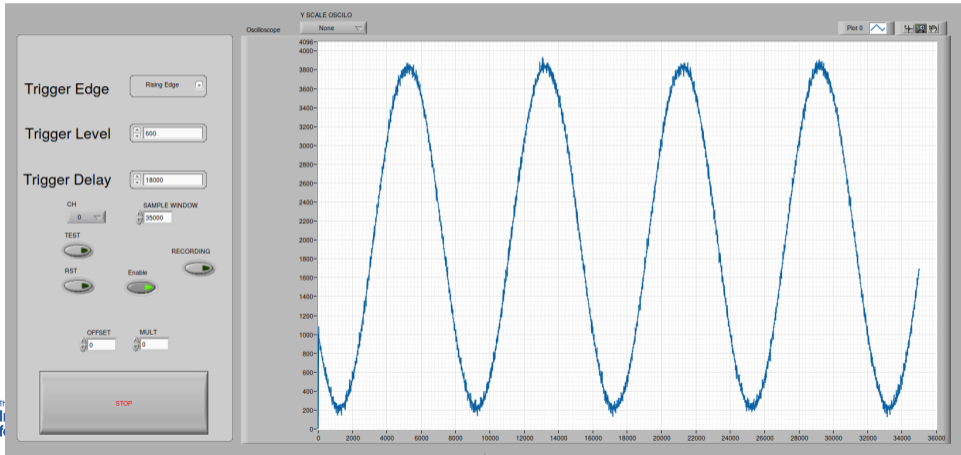

Test Results

Test signal generated from the MSADC readout and stored.

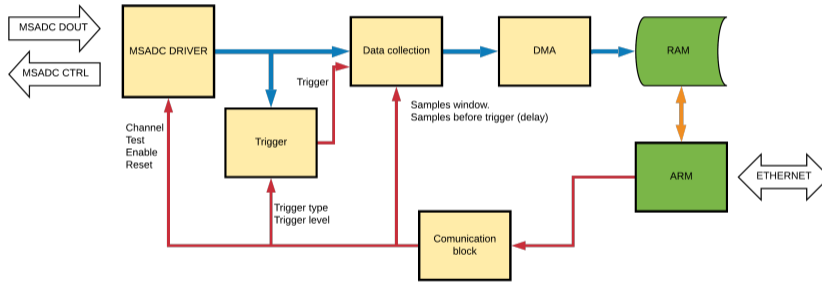

Test Results

MSADC Readout with external signal stimulation.

ICTP International Centre for Theoretical Physics

INFN TRIESTE

ECAL2 data acquisition test

- ADC 500 (8 bits @ 500 MHz)
- 32,000 decimated by two samples (8+1 bits @ 250 Mhz)
- 320 mV (± 160 mv) dynamic range.
