

# Scalar portal and its connection to Higgs physics from a theory viewpoint

Stefania Gori  
UC Santa Cruz

FIPs 2020 - Feebly Interacting Particles 2020

September 4, 2020

# The scalar portal & open problems in particle physics

$$\frac{\xi}{2} |H|^2 s^2$$

**HIGGS BOSON** H

The **HIGGS BOSON** is the theoretical particle of the Higgs mechanism, which physicists believe will reveal how all mass in the universe gets its mass. Many scientists hope that the Large Hadron Collider in Geneva, Switzerland will detect the elusive Higgs Boson when it begins colliding particles at 99.99% the speed of light.

*Wool felt with great fill for maximum mass.*

# Dark sectors & the Higgs portal

**The Higgs portal is one of the three renormalizable portals connecting the SM to the dark sector**

# Dark sectors & the Higgs portal

**The Higgs portal is one of the three renormalizable portals connecting the SM to the dark sector**

In this talk, we will discuss the phenomenology of three simplified models:

Minimal model (SM+S): **1)**  $m_s < m_h / 2$ ; **2)** heavy  $m_s$ ; + more complete theories

**3)** Non minimal model (SM+S+DM):  $m_s > 2m_{\text{DM}}$

# Simplified models

Minimal model (SM+S): **1)**  $m_s < m_h / 2$ ; **2)** heavy  $m_s$ ;  
**3)** Non minimal model (SM+S+DM):  $m_s > 2m_{\text{DM}}$

from symmetry magazine

# How to probe the Higgs portal (light $m_s$ )?

Higgs portal  
interaction

$$\frac{\xi}{2} |H|^2 s^2$$

# How to probe the Higgs portal (light $m_s$ )?

1.

Direct production:

(same production mechanisms as for the SM Higgs)

**$Z_2$  breaking**  
 $(S \rightarrow -S)$

Higgs portal interaction

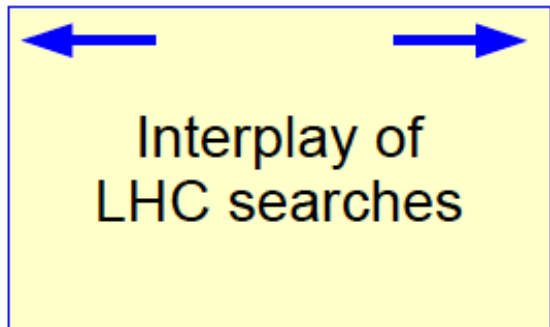

$$\frac{\xi}{2} |H|^2 s^2$$

2.

(125 GeV) Higgs decays:

**$Z_2$  conserving**  
 $(S \rightarrow -S)$

# How to probe the Higgs portal (light $m_s$ )?

1. Direct production:

Higgs portal interaction

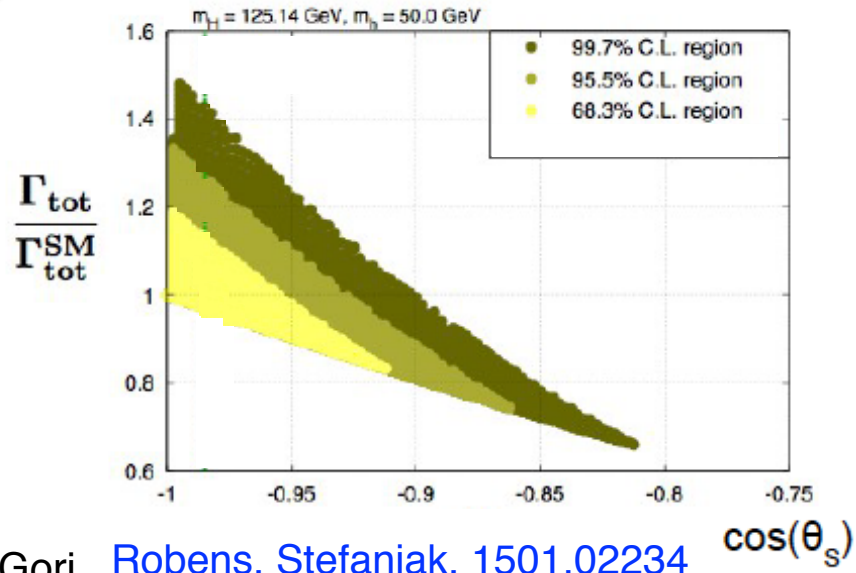

$$\frac{\xi}{2} |H|^2 s^2$$

(125 GeV) Higgs decays:

It does not depend on the mixing,  $\theta_s$

3. The Higgs couplings to SM particles are reduced by a factor of  $\cos(\theta_s)$

The Higgs has some "exotic" signatures

# How to probe the Higgs portal (light $m_s$ )?

1. Direct production:

Higgs portal interaction

$$\frac{\xi}{2} |H|^2 s^2$$

(125 GeV) Higgs decays:

It does not depend on the mixing,  $\theta_s$

3. The Higgs couplings to SM particles are reduced by a factor of  $\cos(\theta_s)$

The Higgs has some "exotic" signatures

# Decays of the dark scalar

If the scalar is heavier than  $\sim 10$  GeV:

- If  $\theta_s = 0$ ,  $s$  is stable

➔  $S$  invisible

- If  $\theta_s \neq 0$ ,  $s$  will decay to SM particles

$$\Gamma(s \rightarrow f\bar{f}) = \sin^2\theta_s \frac{N_c m_s m_f^2}{8\pi v^2} \beta_f^3$$

Main BRs:  $bb$ ,  $\pi\pi$ ,  $cc$ , ...

$\sin(\theta_s) \geq O(10^{-5})$

$S$  decays promptly

$\sin(\theta_s) \leq O(10^{-5})$

$S$  has displaced decays

# Decays of the dark scalar

**If the scalar is heavier than ~10 GeV:**

- If  $\theta_s = 0$ , s is stable  
➔ S invisible

- If  $\theta_s \neq 0$ , s will decay to SM particles

$$\Gamma(s \rightarrow f\bar{f}) = \sin^2\theta_s \frac{N_c m_s m_f^2}{8\pi v^2} \beta_f^3$$

Main BRs: bb,  $\pi\pi$ , cc, ...

$\sin(\theta_s) \geq O(10^{-5})$   
S decays promptly

$\sin(\theta_s) \leq O(10^{-5})$   
S has displaced decays

**If the scalar is lighter than ~10 GeV:**

The calculation of the widths has large theory uncertainties

Several different theoretical methods in the literature.

Winkler, 1809.01876

Particularly relevant for long-lived scalars

1.

# Direct production of a new scalar (LHC)

The production cross section  $\sigma_s = \sigma_{\text{SM Higgs}} \sin^2(\theta_s)$

Same production modes as for the SM Higgs

Only a few LHC searches have been performed.

Examples are  $bbS, S \rightarrow \mu\mu$

$ggS, S \rightarrow \mu\mu$ , (also searched for by LHCb)

$ggS, S \rightarrow \gamma\gamma$

$bbS, S \rightarrow \tau\tau$

1.

# Direct production of a new scalar (LHC)

The production cross section  $\sigma_s = \text{production}_{\text{SM Higgs}} \times \sin^2(\theta_s)$   
 Same production modes as for the SM Higgs

Only a few LHC searches have been performed.

- Examples are  $bbS, S \rightarrow \mu\mu$
- $ggS, S \rightarrow \mu\mu$ , (also searched for by LHCb)
- $ggS, S \rightarrow \gamma\gamma$
- $bbS, S \rightarrow \text{tautau}$

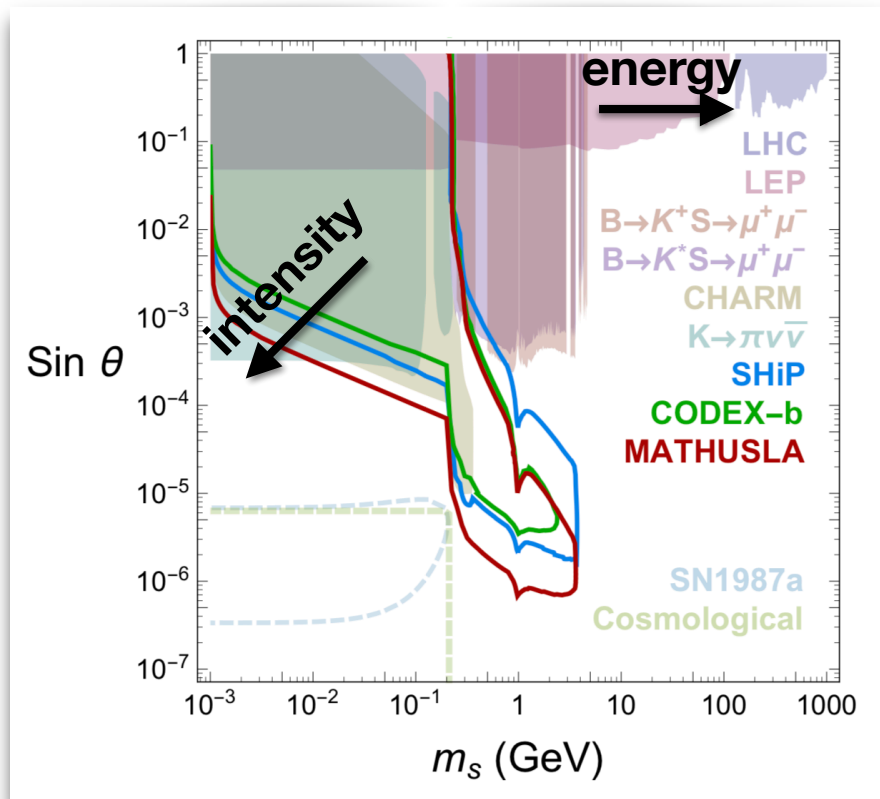

1.

# Direct production of a new scalar (low energy)

In addition to the LHC, high intensity (low energy experiments) can produce the dark scalar through its mixing with the Higgs.

e.g. B decays, Kaon decays, Bremsstrahlung, gluon fusion, ...

Evans, SG, Shelton, 1712.03974

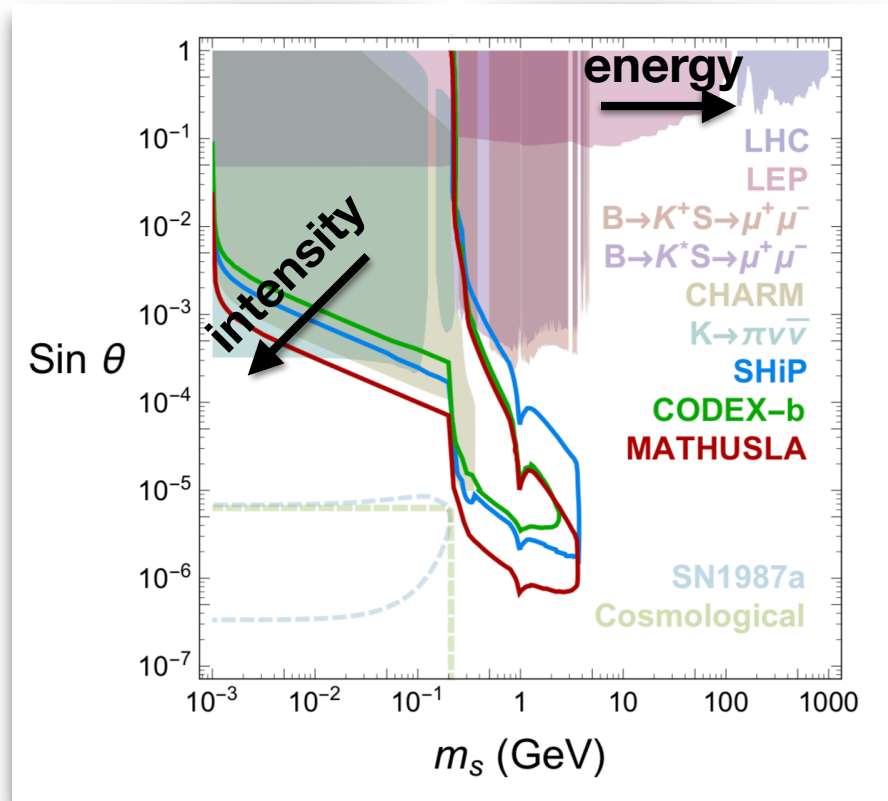

# 1. Direct production of a new scalar (low energy)

In addition to the LHC, high intensity (low energy experiments) can produce the dark scalar through its mixing with the Higgs.  
 e.g. B decays, Kaon decays, Bremsstrahlung, gluon fusion, ...

Evans, SG, Shelton, 1712.03974

Batell, Evans, SG, Rai, 2008.08108

Upgrade of the SeaQuest experiment at Fermilab  
 (see talks by T.Nelson & J.C.Swallow)

The entire region of parameter space is well motivated by **thermal secluded DM models**.

The requirement of thermalization leads to  $\text{Sin}\theta > \sim 10^{-7}$

DM	S
DM	S

2.

# A program for searches for $h \rightarrow ss$

The scalar can decay thanks to its mixing with the Higgs

**Note:** the BR( $h$ ) does not depend on the mixing! We are probing a different parameter, if compared to  $pp \rightarrow s$

2.

# A program for searches for $h \rightarrow ss$

The scalar can decay thanks to its mixing with the Higgs

Many possible signatures to look for

$$gg \rightarrow h \rightarrow ss \rightarrow 4b$$

$$gg \rightarrow h \rightarrow ss \rightarrow 4\gamma$$

$$gg \rightarrow h \rightarrow ss \rightarrow 2b \ 2\mu$$

$$gg \rightarrow h \rightarrow ss \rightarrow 2\gamma 2j$$

$$gg \rightarrow h \rightarrow ss \rightarrow 4\mu$$

$$gg \rightarrow h \rightarrow ss \rightarrow 2\tau \ 2\mu$$

...

both prompt & displaced (or invisible)

+ sub-leading production modes of the Higgs boson

$$\text{e.g. } qq \rightarrow Zh \rightarrow Z(ss) \rightarrow Z(4b) \dots$$

2.

# A program for searches for $h \rightarrow ss$

The scalar can decay thanks to its mixing with the Higgs

Many possible signatures to look for

- $gg \rightarrow h \rightarrow ss \rightarrow 4b$
- $gg \rightarrow h \rightarrow ss \rightarrow 4\gamma$
- $gg \rightarrow h \rightarrow ss \rightarrow 2b 2\mu$
- $gg \rightarrow h \rightarrow ss \rightarrow 2\gamma 2j$
- $gg \rightarrow h \rightarrow ss \rightarrow 4\mu$
- $gg \rightarrow h \rightarrow ss \rightarrow 2\tau 2\mu$
- ...

both prompt & displaced (or invisible)

+ sub-leading production modes of the Higgs boson

e.g.  $qq \rightarrow Zh \rightarrow Z(ss) \rightarrow Z(4b) \dots$

# How to probe the Higgs portal (heavy m<sub>s</sub>)?

1.

Direct production:

(same production mechanisms as for the SM Higgs)

**Z<sub>2</sub> breaking**  
(S → -S)

Higgs portal interaction

$$\frac{\xi}{2} |H|^2 s^2$$

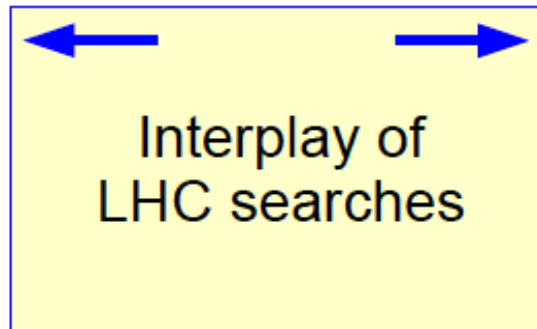

2.

Di-Higgs production

**Z<sub>2</sub> breaking**  
(S → -S)

The SM di-Higgs production cross section is rather small at the LHC: ~37 fb (@14 TeV)

3.

Higgs coupling measurements

**Z<sub>2</sub> breaking**  
(S → -S)

Large enhancements are possible in Higgs portal models.

2.

# Di-Higgs production & the Higgs portal

Constraint from the present  
ATLAS & CMS  
resonant di-Higgs  
production searches

Lewis, Sullivan, 1701.08774

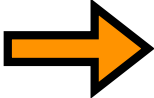

Dawson, Lewis, 1508.05397

Carena, Liu, Riembau, 1801.00794

**Note:**

to obtain a more precise bound, one should consider interference effects between the resonant decay and the SM diagrams

# Extended Higgs portal simplified models

DM models can have the DM state lighter than the scalar mediator,  $m_s > 2m_{DM}$ .  
If so, the dark scalar can be produced through the Higgs portal and **decay invisibly** to DM.  Different signatures at high energy and high intensity  
**2 different parameters for production and decay**

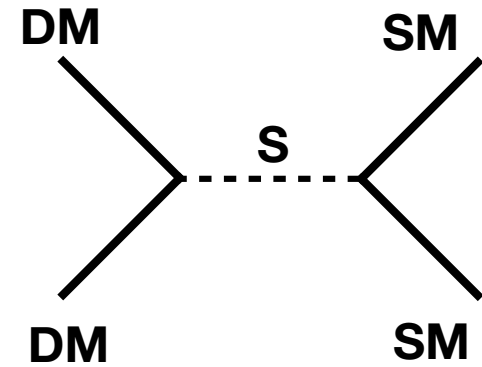

# Extended Higgs portal simplified models

DM models can have the DM state lighter than the scalar mediator,  $m_s > 2m_{DM}$ . If so, the dark scalar can be produced through the Higgs portal and **decay invisibly** to DM. **→** Different signatures at high energy and high intensity

**2 different parameters for production and decay**

LHC mono-X searches

# (More complete) models:

- \* Twin Higgs models
- \* Models for electroweak phase transitions

# Twin Higgs models & the hierarchy problem

$$\mathbf{SM}_A \times \mathbf{SM}_B \times \mathbf{Z}_2$$

Global symmetry of the scalar potential (e.g. SU(4))

→ The SM Higgs is a (massless) Nambu-Goldstone boson

$$H = \begin{pmatrix} H_A \\ H_B \end{pmatrix} \quad \begin{array}{l} \sim \text{SM Higgs doublet} \\ \text{Twin Higgs doublet} \end{array}$$

$$V(H) = -m^2 H^\dagger H + \lambda (H^\dagger H)^2$$

# Twin Higgs models & the hierarchy problem

$$\boxed{SM_A \times SM_B \times Z_2}$$

Global symmetry of the scalar potential (e.g. SU(4))

→ The SM Higgs is a (massless) Nambu-Goldstone boson

$$H = \begin{pmatrix} H_A \\ H_B \end{pmatrix} \begin{array}{l} \sim \text{SM Higgs doublet} \\ \text{Twin Higgs doublet} \end{array}$$

$$V(H) = -m^2 H^\dagger H + \lambda (H^\dagger H)^2$$

Loop corrections to the Higgs mass:  $\frac{3}{8\pi^2} \Lambda^2 (y_A^2 H_A^\dagger H_A + y_B^2 H_B^\dagger H_B)$

$$\boxed{Z_2 \Rightarrow y_A = y_B}$$

Loop corrections to mass are SU(4) symmetric

→ no quadratically divergent corrections!

# Twin Higgs models & the hierarchy problem

$$\mathbf{SM}_A \times \mathbf{SM}_B \times \mathbf{Z}_2$$

Global symmetry of the scalar potential (e.g. SU(4))

→ The SM Higgs is a (massless) Nambu-Goldstone boson

$$H = \begin{pmatrix} H_A \\ H_B \end{pmatrix} \quad \begin{array}{l} \sim \text{SM Higgs doublet} \\ \text{Twin Higgs doublet} \end{array}$$

$$V(H) = -m^2 H^\dagger H + \lambda (H^\dagger H)^2$$

Loop corrections to the Higgs mass:

$$\frac{3}{8\pi^2} \Lambda^2 (y_A^2 H_A^\dagger H_A + y_B^2 H_B^\dagger H_B)$$

SU(4) and Z<sub>2</sub> are (softly) broken:

$$v_A \neq v_B$$

$$(f^2 \equiv v_A^2 + v_B^2 \gg 246 \text{ GeV})$$

$$\sin \theta \sim \frac{v}{f} \quad \text{mixing between the SM and the twin Higgs}$$

$$\mathbf{Z}_2 \Rightarrow y_A = y_B$$

Loop corrections to mass are SU(4) symmetric  
→ no quadratically divergent corrections!

# Phenomenology of the twin Higgs

**A typical spectrum:**

# Phenomenology of the twin Higgs

## 1. Production of the twin Higgs

The twin Higgs will mix with the 125 GeV Higgs with a mixing angle  $\sim v/f$

Because of this mixing, it can be produced as a SM Higgs boson (reduced rates!)

### A typical spectrum:

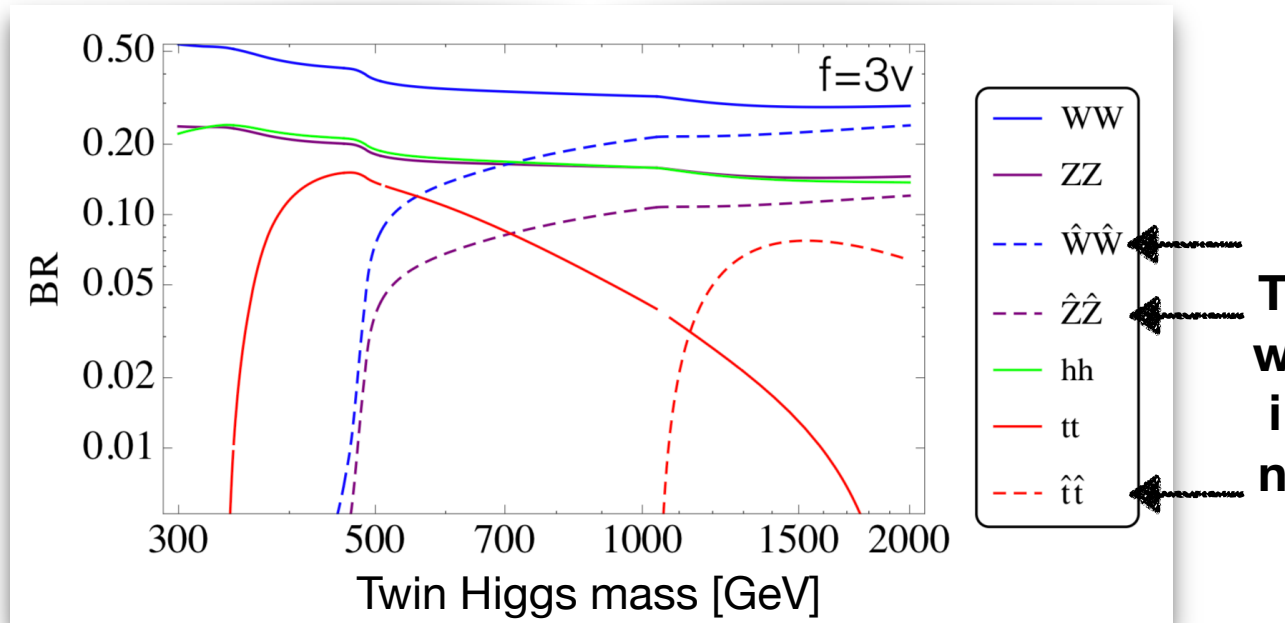

# Phenomenology of the twin Higgs

## 1. Production of the twin Higgs

The twin Higgs will mix with the 125 GeV Higgs with a mixing angle  $\sim v/f$

Because of this mixing, it can be produced as a SM Higgs boson (reduced rates!)

## 2. Decay of the twin Higgs

N.Craig

### A typical spectrum:

**Twin particles** undertake cascade decays  
to (typically) long lived glue-balls

# Long-lived signatures from twin Higgs decays

Craig et al.,  
1501.05310

**Twin Higgs**  
**H<sub>T</sub>**

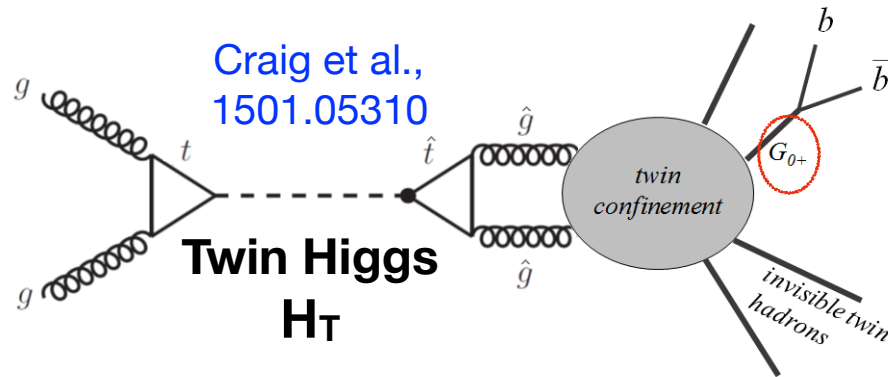

**Glue-ball.**

O<sup>++</sup> mixes with the 125 GeV Higgs and decays typically displaced.

$$\frac{\alpha_s^B}{3\pi} \left[ \frac{y^2}{M^2} \right] |H|^2 G_{\mu\nu}^{(B)} G^{(B)\mu\nu}$$

**Signature: H<sub>T</sub> → ≥ 2 displaced**

# Long-lived signatures from twin Higgs decays

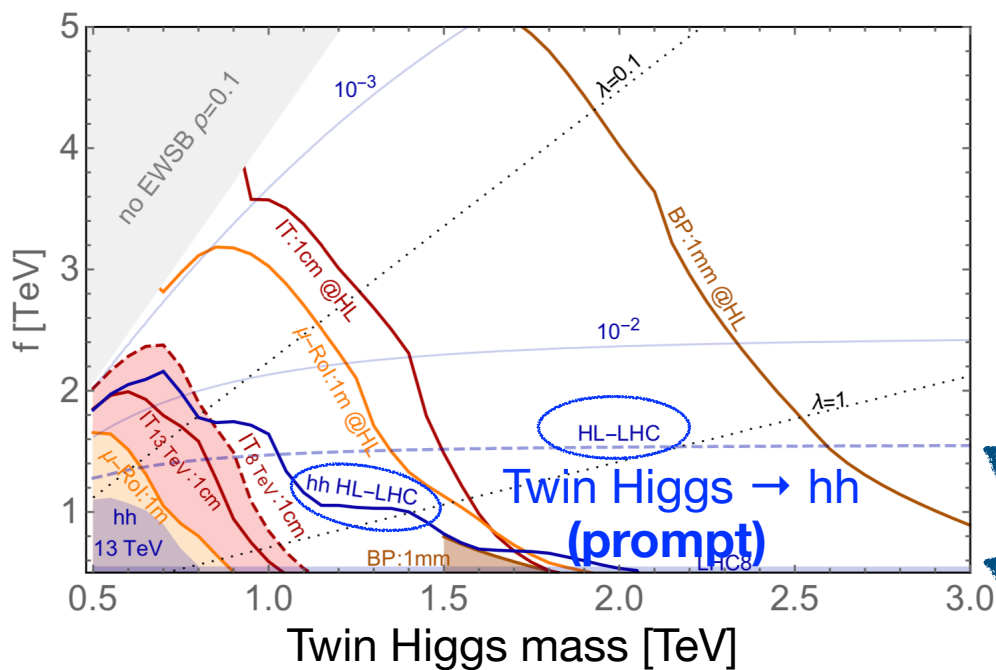

Glue-ball.

$O_{++}$  mixes with the 125 GeV Higgs and decays typically displaced.

$$\frac{\alpha_s^B}{3\pi} \left[ \frac{y^2}{M^2} \right] |H|^2 G_{\mu\nu}^{(B)} G^{(B)\mu\nu}$$

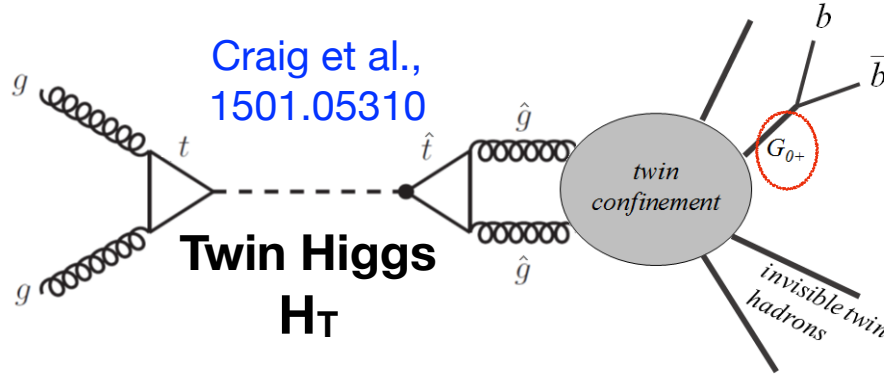

**Signature:  $H_T \rightarrow \geq 2$  displaced**

125 GeV Higgs coupling measurements

Alipour-Fard, Craig, SG, Koren, Redigolo, 1812.09315

# Long-lived signatures from twin Higgs decays

**Glue-ball.**

$O_{++}$  mixes with the 125 GeV Higgs and decays typically displaced.

$$\frac{\alpha_s^B}{3\pi} \left[ \frac{y^2}{M^2} \right] |H|^2 G_{\mu\nu}^{(B)} G^{(B)\mu\nu}$$

**Signature:  $H_T \rightarrow \geq 2$  displaced**

**Twin Higgs  $\rightarrow$  glue-balls:  
(long lived)**

CMS inner tracker analysis;  
CMS beam pipe analysis;  
ATLAS muon spectrometer analysis

The relative strength depends  
on other parameters of the theory

125 GeV Higgs coupling  
measurements

Alipour-Fard, Craig, SG, Koren, Redigolo, 1812.09315

# Long-lived signatures from twin Higgs decays

## Glue-ball.

$O^{++}$  mixes with the 125 GeV Higgs and decays typically displaced.

$$\frac{\alpha_s^B}{3\pi} \left[ \frac{y^2}{M^2} \right] |H|^2 G_{\mu\nu}^{(B)} G^{(B)\mu\nu}$$

**Signature:  $H_T \rightarrow \geq 2$  displaced**

## Many additional opportunities!

- study the pheno of the heavier glue-balls (some mix with the pseudo scalar Higgs)
- displaced + invisible signatures
- sub-leading twin Higgs production mechanisms?
- Even more rich pheno in SUSY twin Higgs models

Alipour-Fard, Craig, SG, Koren, Redigolo, 1812.09315

# Effects on the 125 GeV Higgs pheno

The 125 GeV Higgs will mix with the twin Higgs with a mixing angle  $\sim v/f$

- \* The Higgs couplings to the SM particles will be reduced
- \* The Higgs will decay to light twin states

# Effects on the 125 GeV Higgs pheno

The 125 GeV Higgs will mix with the twin Higgs with a mixing angle  $\sim v/f$

- \* The Higgs couplings to the SM particles will be reduced
- \* The Higgs will decay to light twin states

Burdman et al, 1411.3310

# Higgs portal and electroweak phase transitions

Light new physics weakly coupled to the Higgs can induce a strong first-order electroweak phase transition

To have a strong first order phase transition ( $v_c/T_c \geq 1$ ), one needs a sizable value for the hSS coupling.  
In particular:

Analysis of the  
finite-temperature  
**effective potential**  
of SM+S

# Higgs portal and electroweak phase transitions

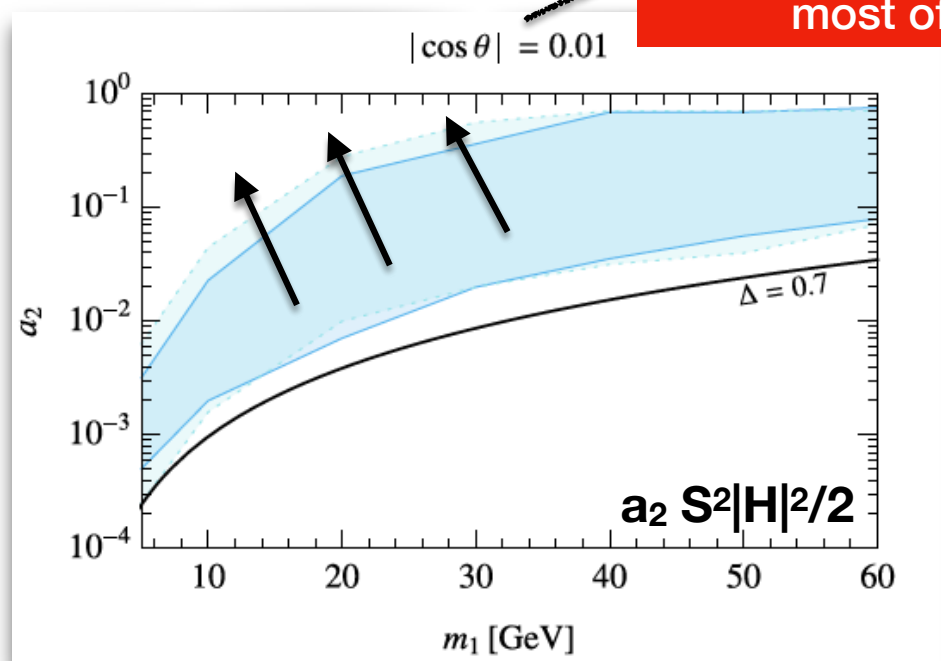

Light new physics weakly coupled to the Higgs can induce a strong first-order electroweak phase transition

To have a strong first order phase transition ( $v_c/T_c \geq 1$ ), one needs a sizable value for the  $hSS$  coupling.

In particular:

Analysis of the finite-temperature effective potential of SM+S

Higgs exotic decays can probe most of the region

Kozaczuk, Ramsey-Musolf, Shelton, 1911.10210

# Conclusions and outlook

## Complementarity of...

- \* Higgs coupling measurements
- \* Higgs exotic decays
- \* Direct production of new scalars (LHC & high intensity experiments)
- \* Di-Higgs searches

...in probing the Higgs portal

$$\frac{\xi}{2} |H|^2 s^2$$

## Many future experimental opportunities

## An (incomplete set of) theory targets:

- \* Thermal Dark sector (lower bound on  $\text{Sin}\theta$ ) for secluded DM models
- \* Thermal line for non-secluded DM models
- \* Strong first order electroweak phase transition
