

Status and plans for the CMS High Granularity Calorimeter upgrade project

Monday 25 May 2020 14:36 (18 minutes)

The CMS Collaboration is preparing to build replacement endcap calorimeters for the HL-LHC era. The new high-granularity calorimeter (HGCal) is, as the name implies, a highly-granular sampling calorimeter with approximately six million silicon sensor channels ($\sim 1.1\text{cm}^2$ or 0.5cm^2 cells) and about four hundred thousand channels of scintillator tiles readout with on-tile silicon photomultipliers. The calorimeter is designed to operate in the harsh radiation environment at the HL-LHC, where the average number of interactions per bunch crossing is expected to exceed 140. Besides measuring energy and position of the energy deposits the electronics is also designed to measure the time of their arrival with a precision on the order of 50 ps. We will present the current status of the project, the many lessons learnt so far and our future plans.

Funding information

Authors: MARTINEZ RIVERO, Celso (CSIC - Consejo Sup. de Investig. Cientif. (ES)); QUAST, Thorben (Rheinisch Westfaelische Tech. Hoch. (DE))

Presenter: QUAST, Thorben (Rheinisch Westfaelische Tech. Hoch. (DE))

Session Classification: Experiments: Calorimeters

Track Classification: Experiments: Calorimeters
