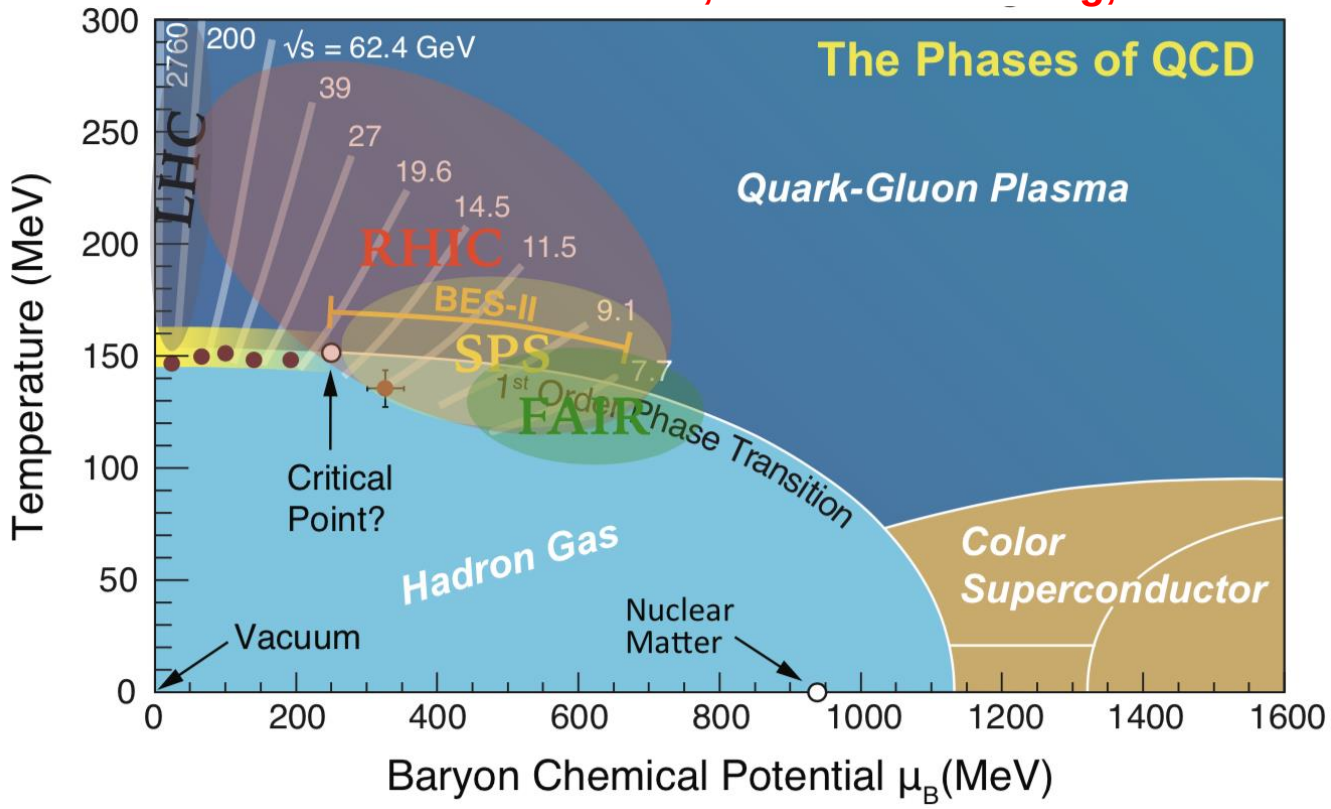
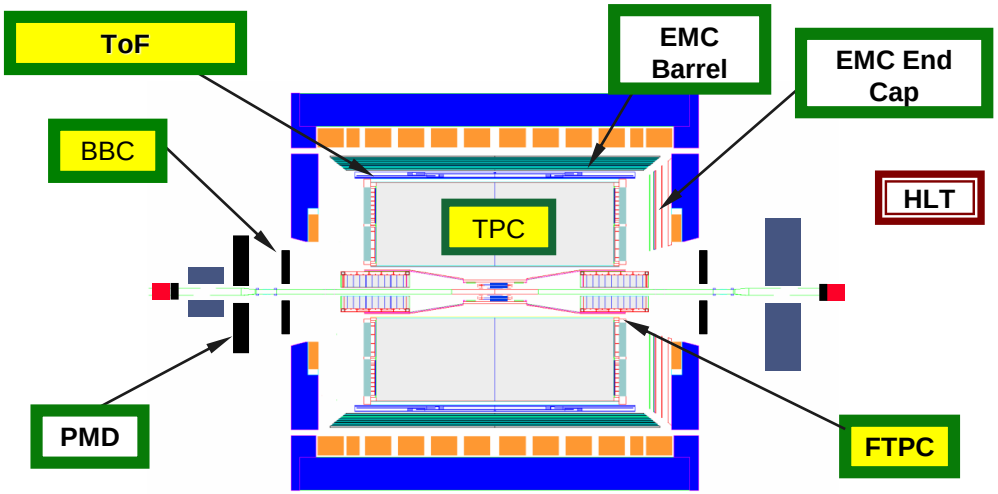
QCD phase diagram

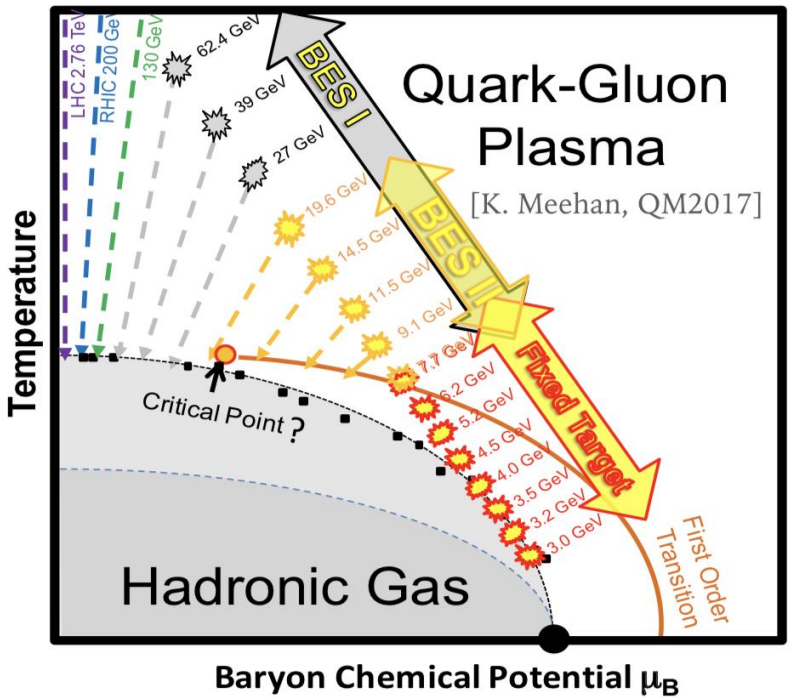
B. Müller, BEST Col. Meeting, 2016



- **RHIC Beam Energy Scan**
  Cover the intermediate baryon density region
  Look for **onset of de-confinement, phase boundary** and critical point

STAR BES





- STAR:
  Collider experiment at RHIC
- full azimuthal coverage at mid-rapidity
- BES-I (completed)
  Au+Au $\sqrt{s_{NN}}$ = 62.4 – 7.7 GeV
- BES-II (on-going)
  Au+Au $\sqrt{s_{NN}}$ = 19.6 – 7.7 GeV
- Fixed-target (on-going)
  Au+Au $\sqrt{s_{NN}}$ = 7.7 – 3.0 GeV
  μ_B up to 721 MeV

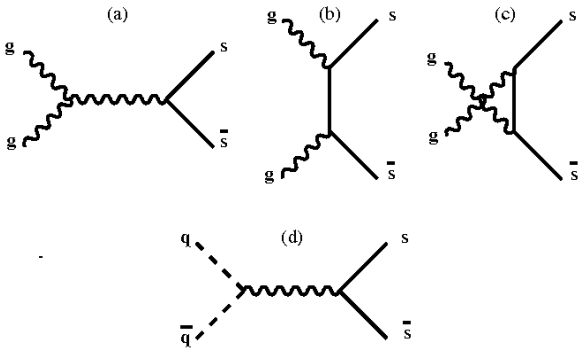
Why strangeness?

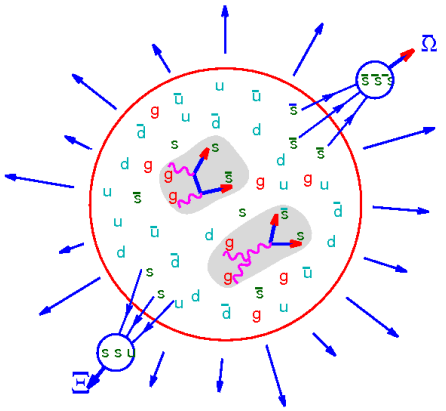
Rafelski & Müller, 1982

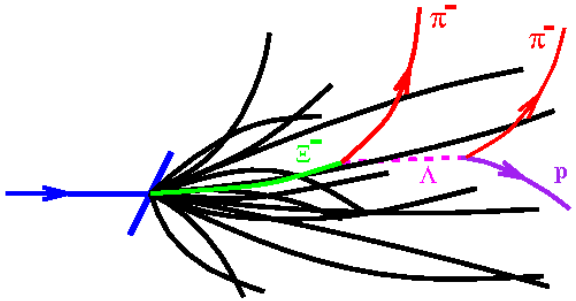
- Strange quarks
  - Not exist in colliding nuclei
  - Current mass ~100 MeV < T_c
  - Easily pair-produced in de-confined QGP medium

⟶ Strangeness enhancement !

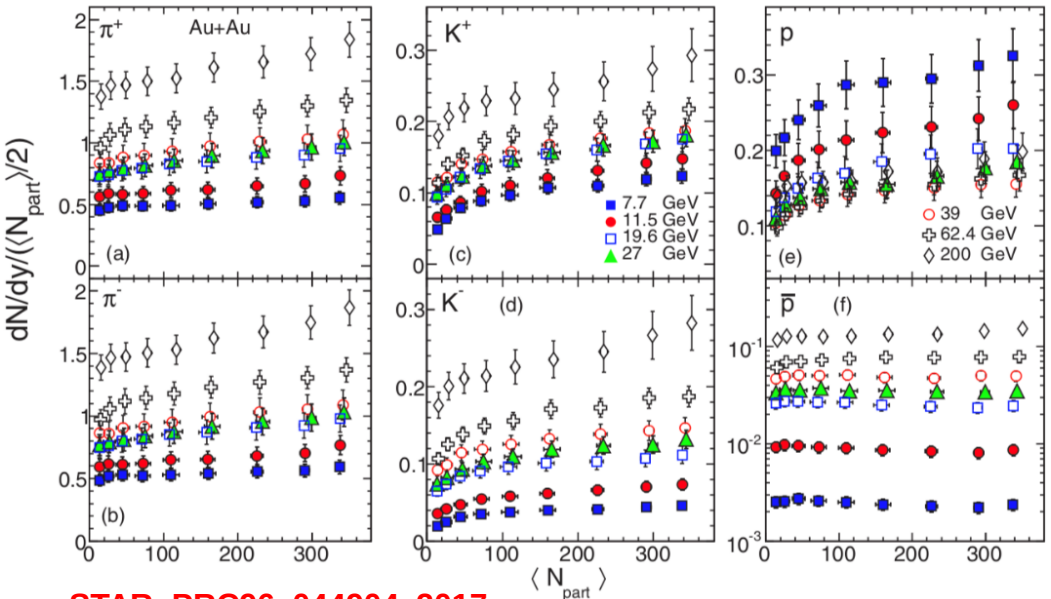
- Hadrons with (multiple) strange quarks
  - Small hadronic cross section
  - Sensitive to the early stage dynamics of the medium
  - Can be easily reconstructed and identified in experiment, up to high p_T !



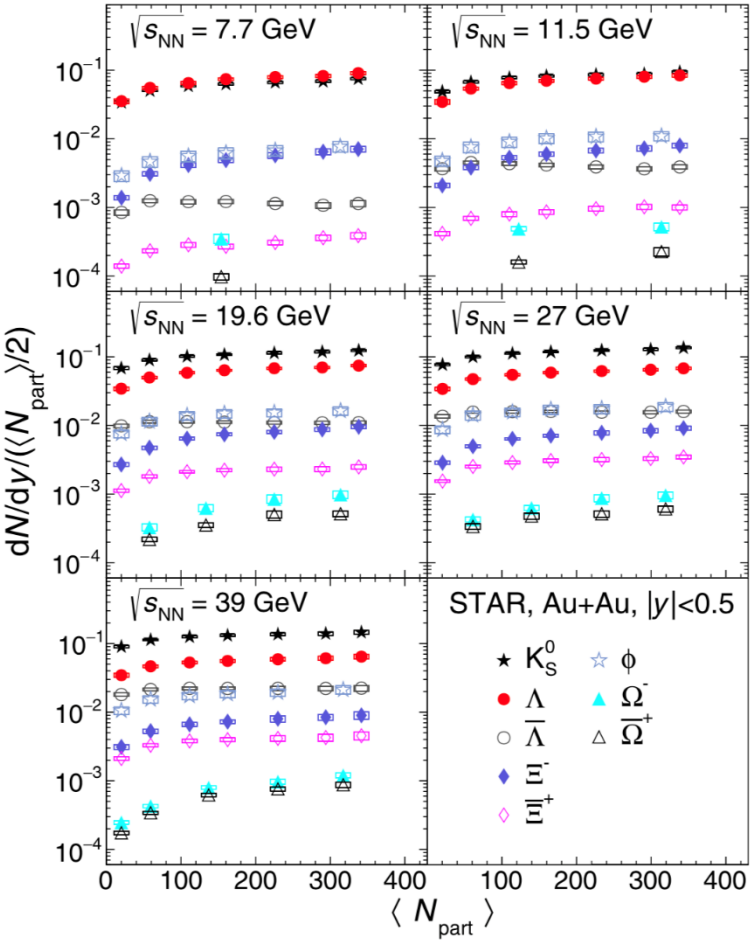




Particle yields, d*N*/d*y*, at mid-*y* (STAR BES-I)



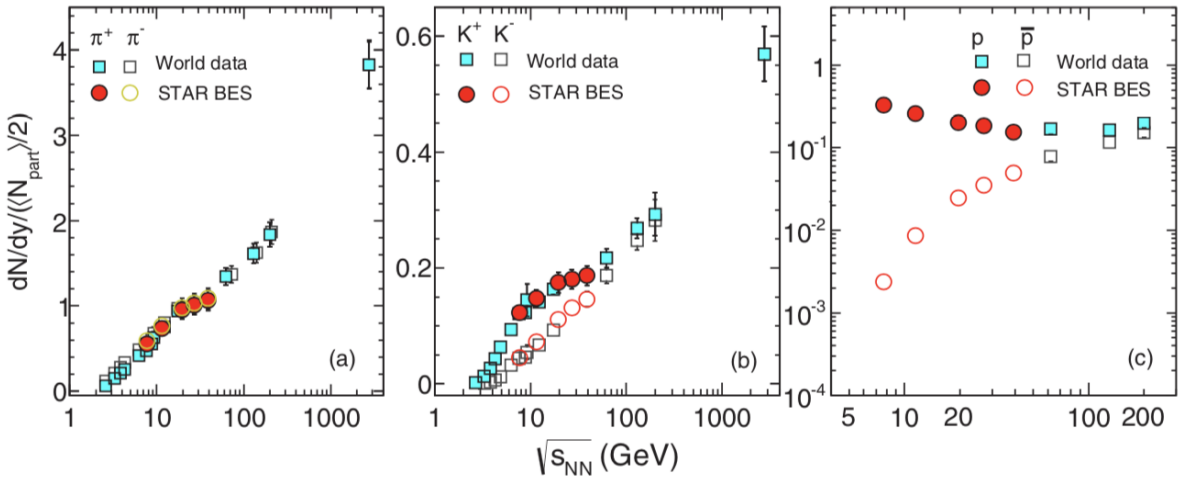
STAR, PRC96, 044904, 2017



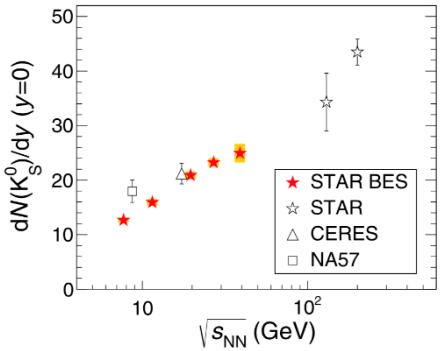
STAR, arXiv:1906.03732, to appear in PRC

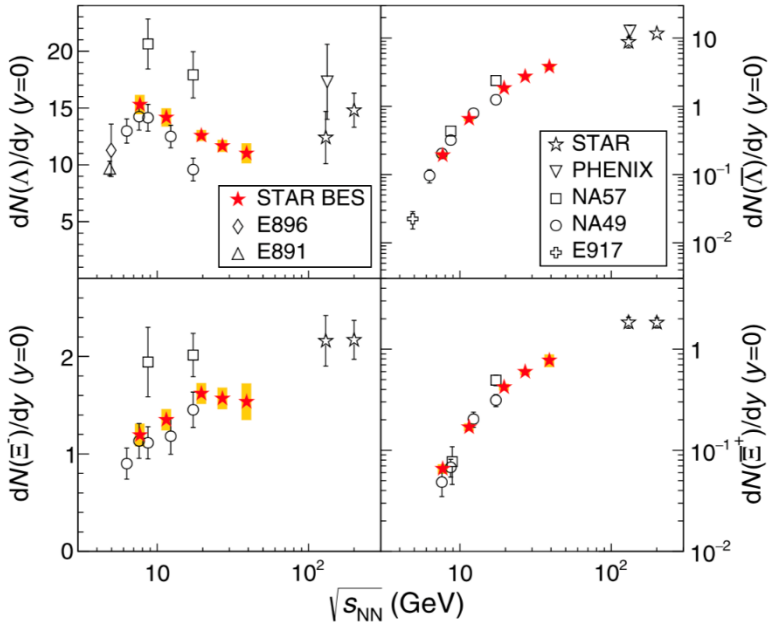
- Yield per participating pair increases towards central and higher energies in general
- Exceptions:
  - p and Λ yields decrease towards higher energy
  - $\bar{p}$ and $\bar{\Lambda}$ has weak centrality dependence

Particle yields in central collisions



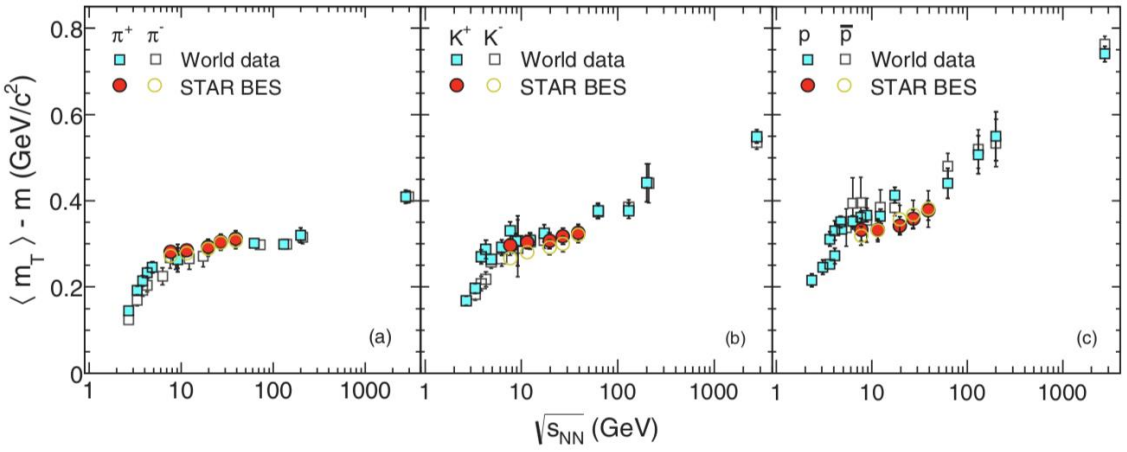
STAR, PRC96, 044904, 2017
STAR, arXiv:1906.03732

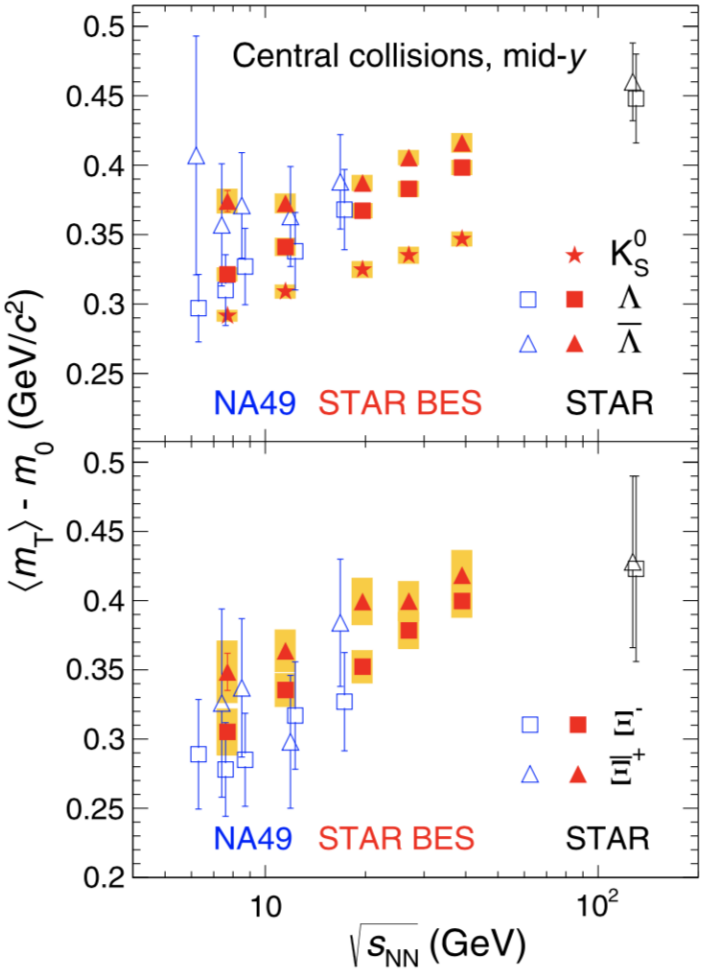




- STAR BES-I data consistent with published data in general
- Rich structure in these excitation functions
- p and Λ yields reach minimum at 39 GeV: interplay of baryon transport and pair production

Average transverse mass

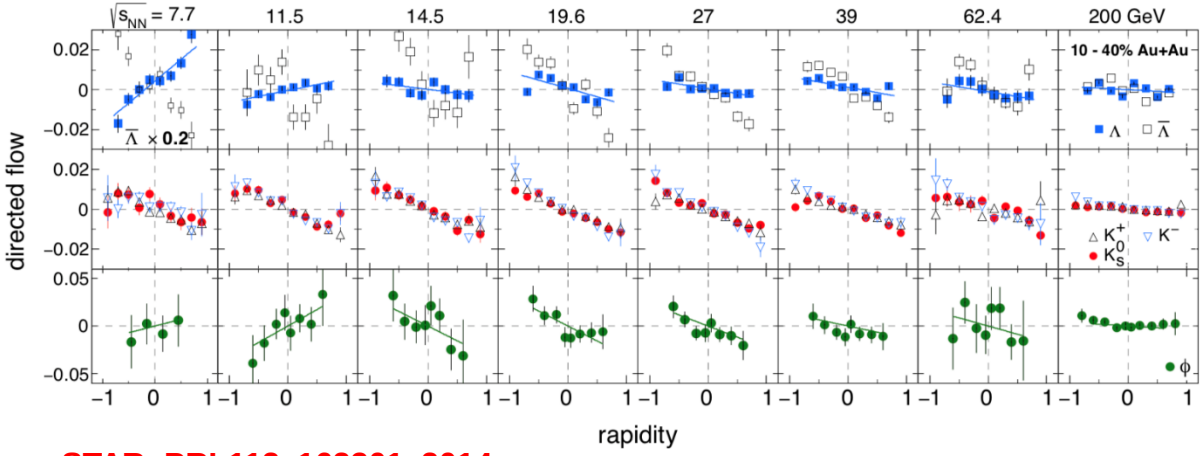


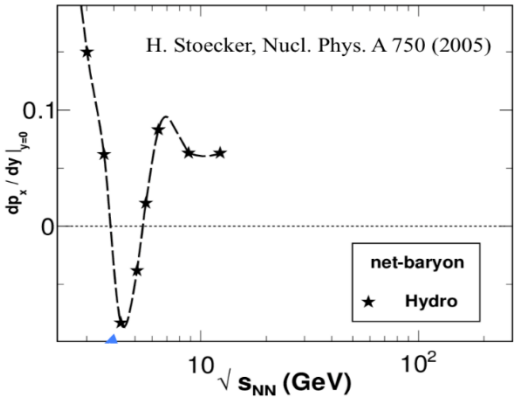


STAR, PRC96, 044904, 2017
STAR, arXiv:1906.03732

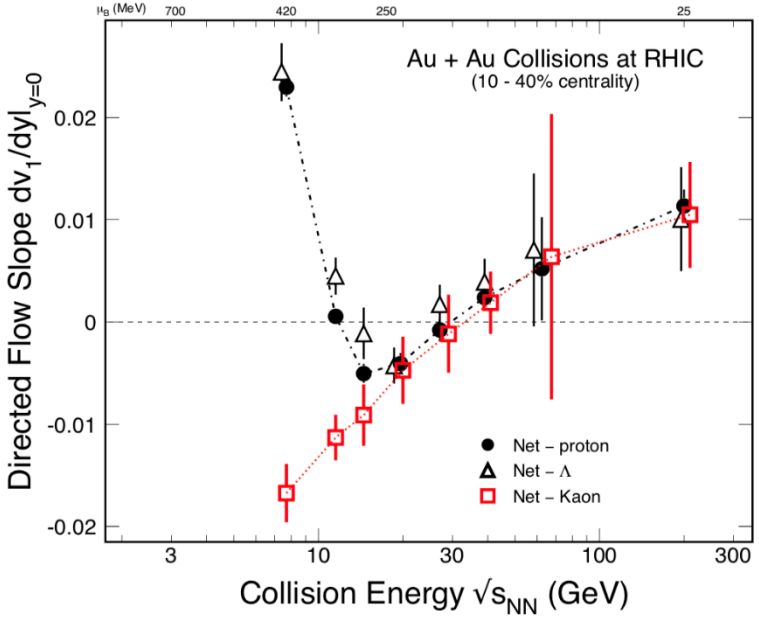
- A step-like structure can be seen in the energy dependence, first-order phase transition?
- Λ and $\bar{\Lambda}$ show split at lower energies might be due to baryon-antibaryon annihilations at high baryon density

Directed flow (STAR BES-I)





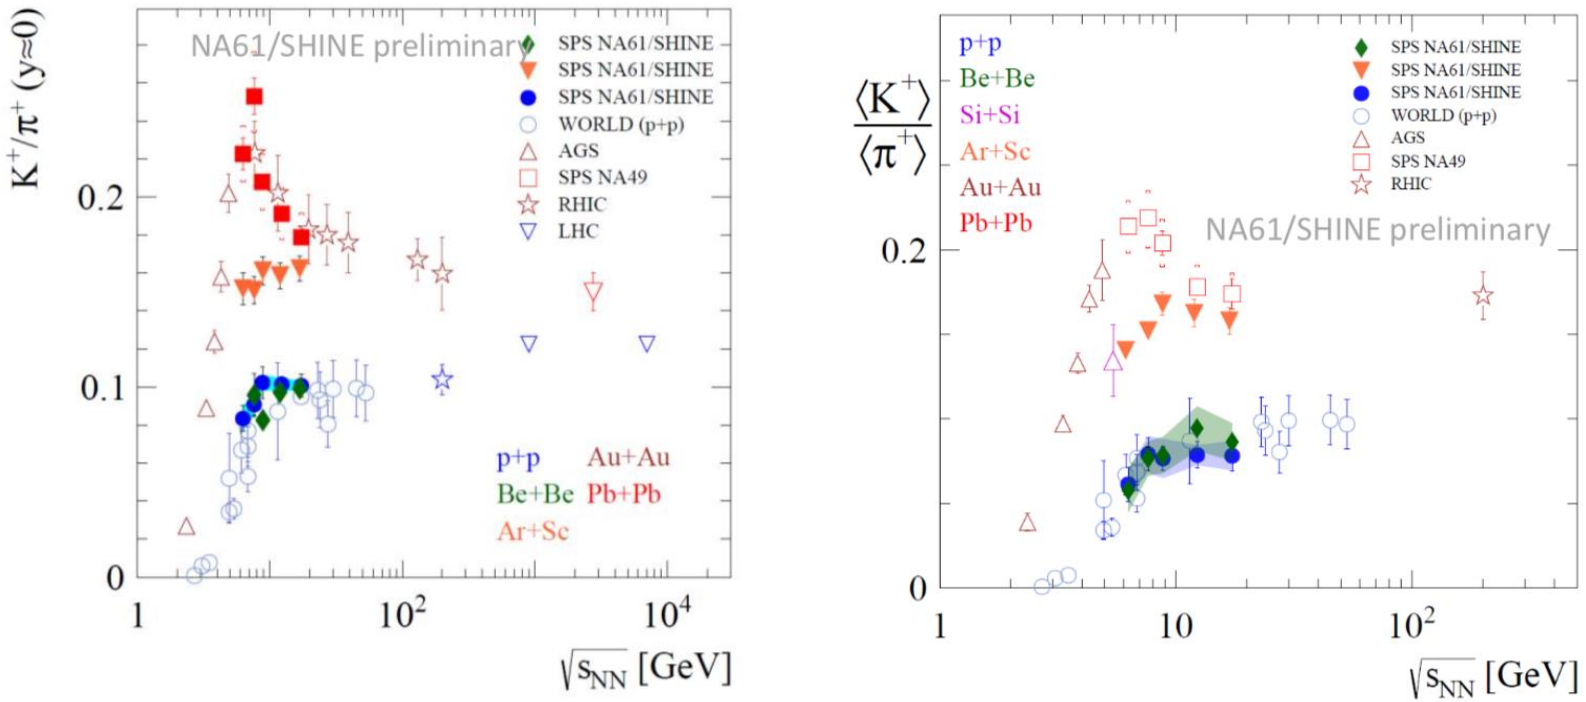
STAR, PRL112, 162301, 2014
STAR, PRL120, 062301, 2018



- Sign change of proton dv_1/dy, softening of EOS, first-order phase transition
- Double sign change seen in net-proton, net-Λ, not seen in net-kaon
- Need theory to explain

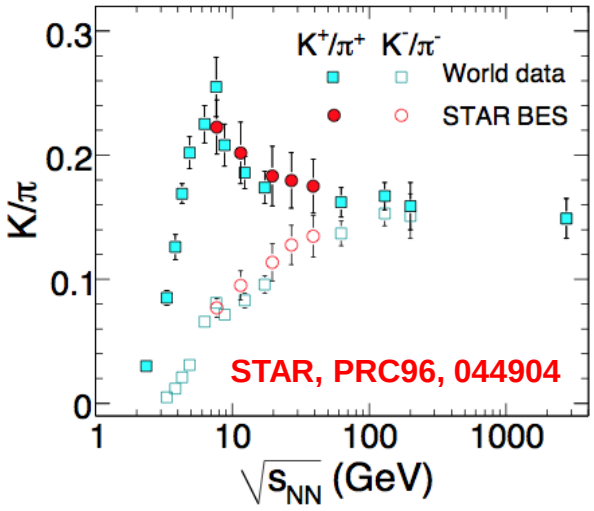
K^+/π^+ ratio (NA61/SHINE)

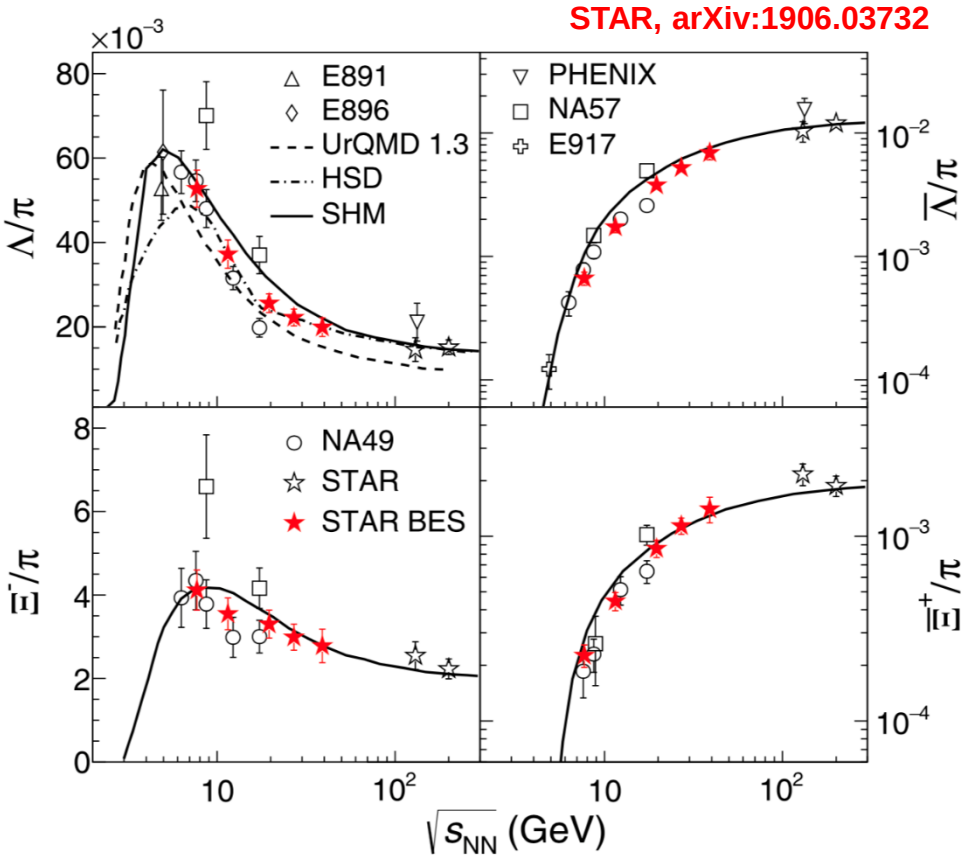
P. Podlaski, SQM2019



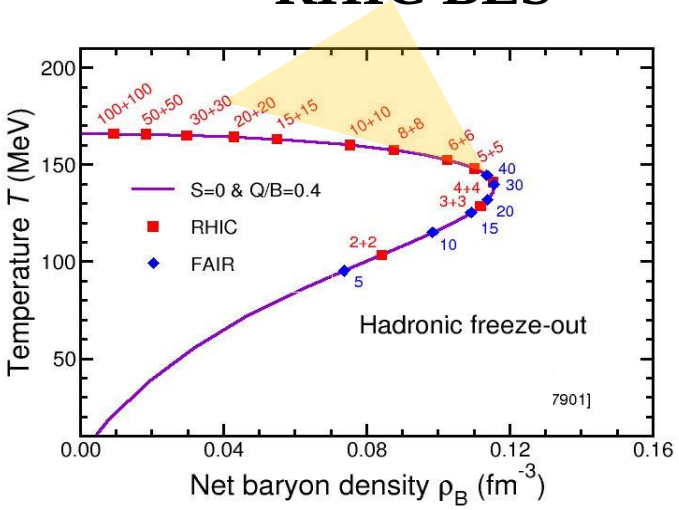
- Plateau like structure visible in p+p
- Be+Be close to p+p
- Ar+Sc is higher than p+p but form of energy dependence is similar to p+p (no horn)

Strange hadron to pion ratio (STAR BES-I)





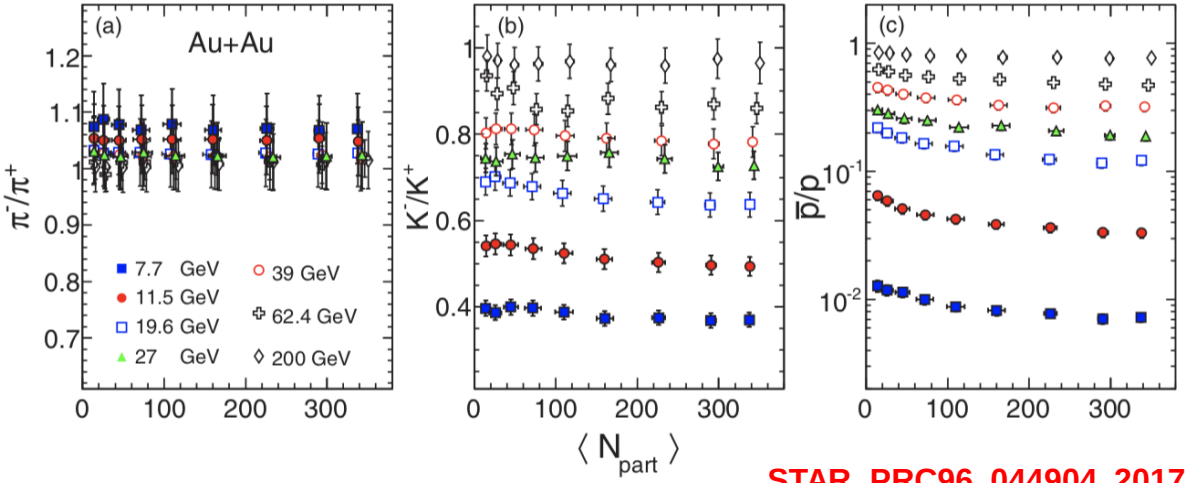
RHIC BES



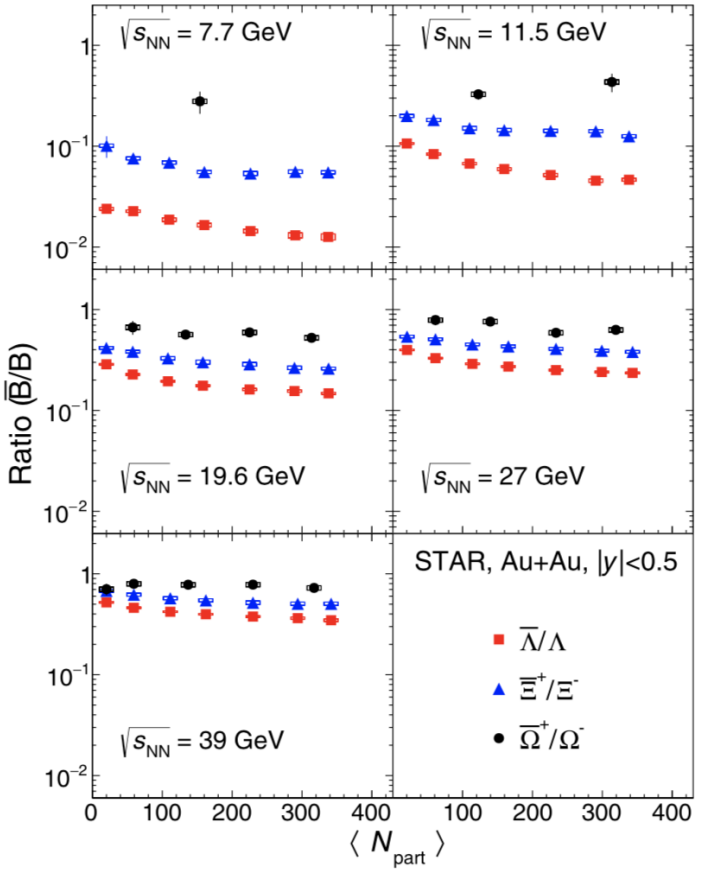
J. Randrup et al., PRC 74, 047901 (2006)

- Particle ratios consistent with NA49, consistent with the picture of a **maximum net-baryon density around $\sqrt{s_{NN}} \sim 8$ GeV at freeze-out**

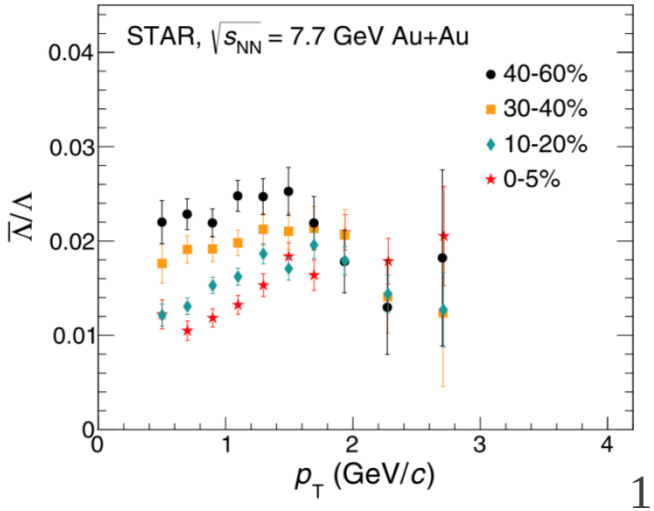
Anti-hadron to hadron ratio



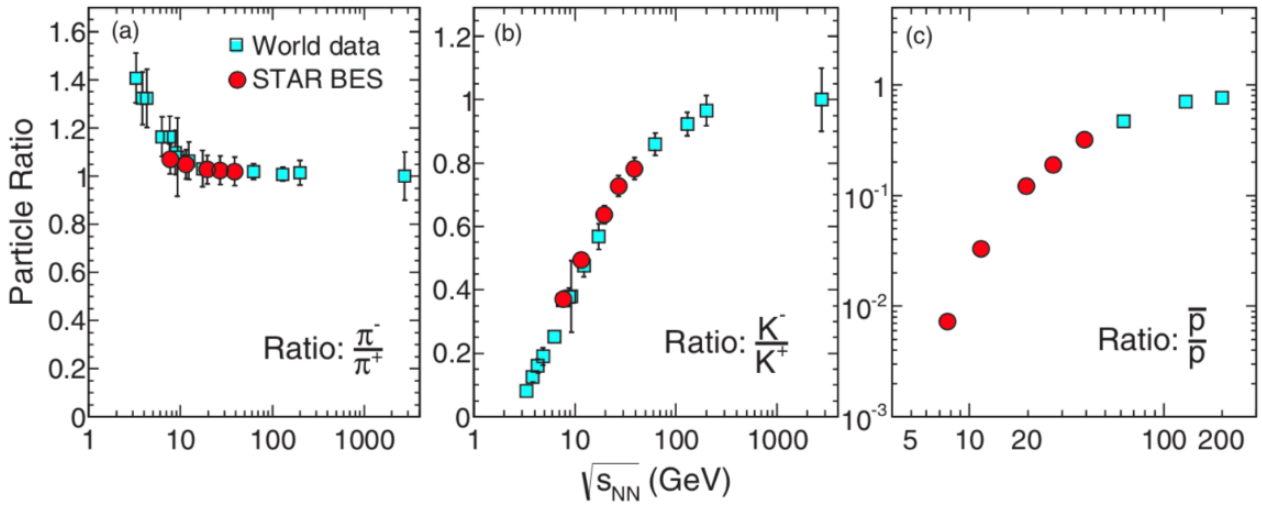
STAR, PRC96, 044904, 2017
STAR, arXiv:1906.03732



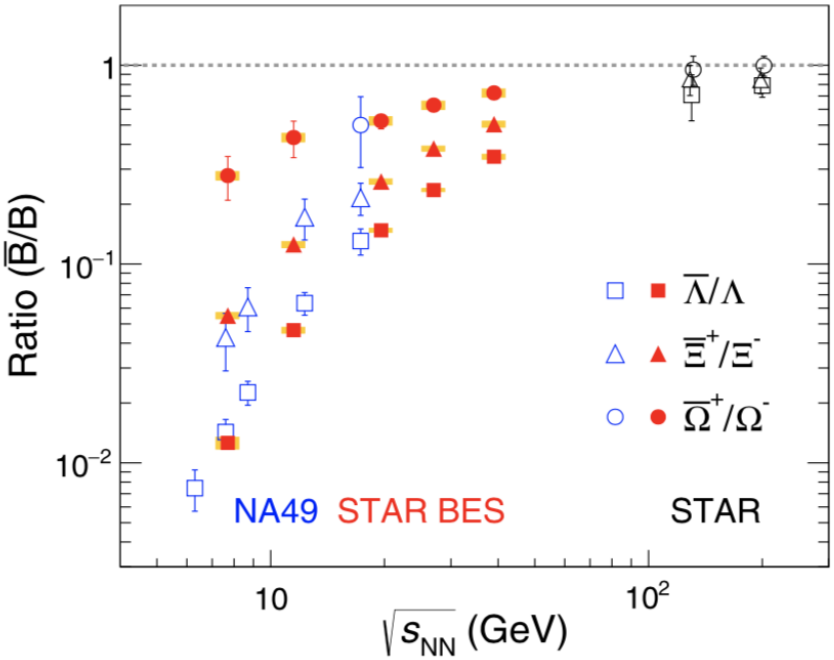
- Centrality dependence of $\bar{B}/B$ ratios:
  peripheral > central
- This effect is more prominent at lower energies.
  baryon stopping and/or anti-baryon absorption
- **Loss of low p_T $\bar{\Lambda}$ in central collisions**



Anti-hadron to hadron ratio



STAR, PRC96, 044904, 2017
STAR, arXiv:1906.03732



- STAR BES data lie in a trend with NA49 data
- $\bar{B}/B$ ratios increase with number of strange quarks at low energies
  $\bar{\Omega}^+/\Omega^- > \bar{\Xi}^+/\Xi^- > \bar{\Lambda}/\Lambda > \bar{p}/p$

Anti-hyperon to hyperon ratio

$$n_i = \frac{g_i}{(2\pi^2)} \gamma_S^{|S_i|} m_i^2 T K_2(m_i/T) \exp(\mu_i/T)$$

$$\frac{\bar{\Lambda}}{\Lambda} = \exp(-\frac{2\mu_B}{T} + \frac{2\mu_S}{T}) \qquad \ln(\frac{\bar{\Lambda}}{\Lambda}) = -\frac{2\mu_B}{T} + \frac{2\mu_S}{T}$$

$$\frac{\bar{\Xi}^+}{\Xi^-} = \exp(-\frac{2\mu_B}{T} + \frac{4\mu_S}{T}) \qquad \ln(\frac{\bar{\Xi}^+}{\Xi^-}) = -\frac{2\mu_B}{T} + \frac{4\mu_S}{T}$$

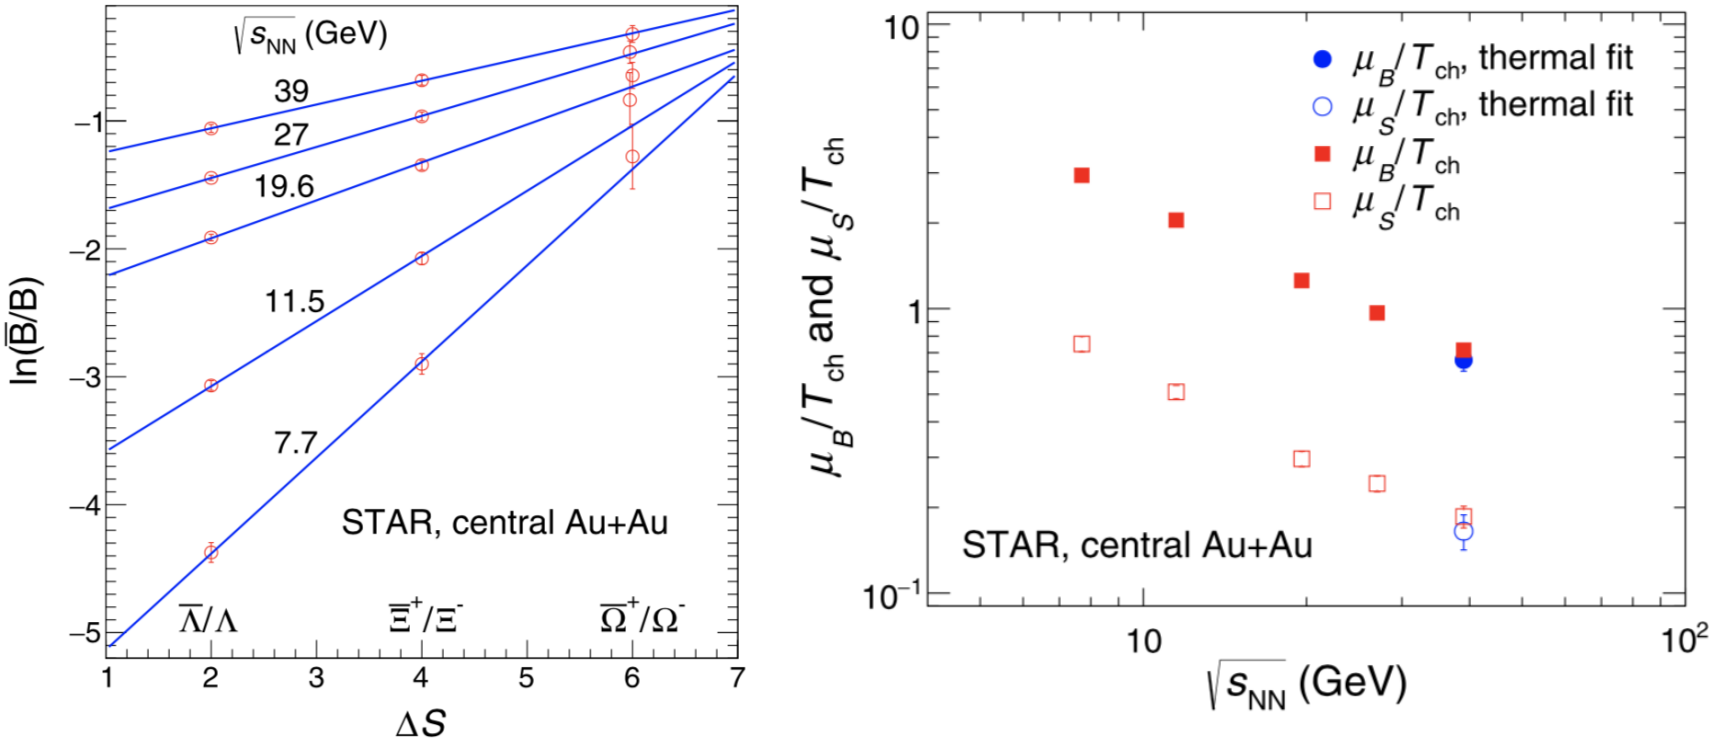
$$\frac{\bar{\Omega}^+}{\Omega^-} = \exp(-\frac{2\mu_B}{T} + \frac{6\mu_S}{T}) \qquad \ln(\frac{\bar{\Omega}^+}{\Omega^-}) = -\frac{2\mu_B}{T} + \frac{6\mu_S}{T}$$

- T is the temperature.
- μ_B is the baryon chemical potential.
- μ_S is the strangeness chemical potential.

(arXiv:nucl-th/9704046v1 by J.Cleymans & Phys. Rev. C 71(2005)054901)

μ_S/T_{ch} and μ_B/T_{ch}

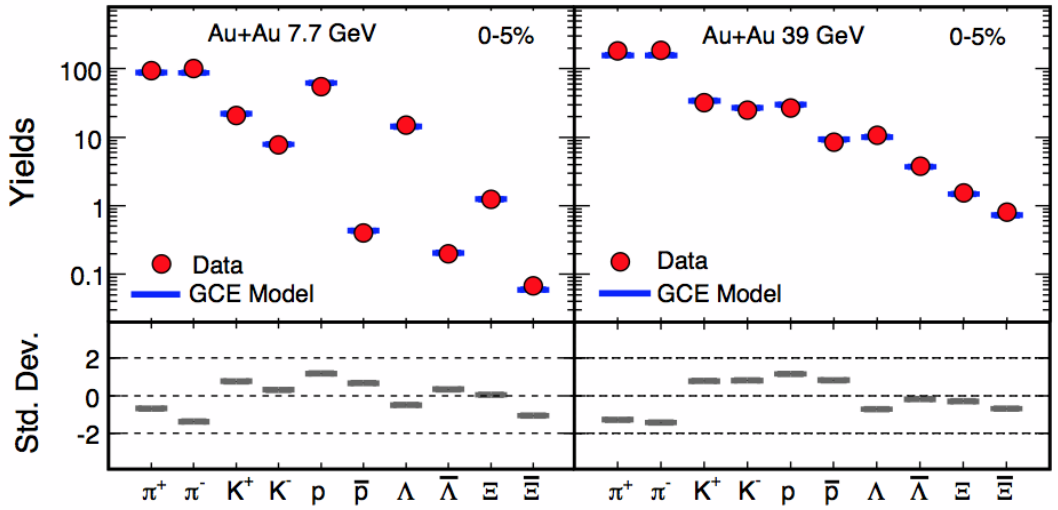
STAR, arXiv:1906.03732

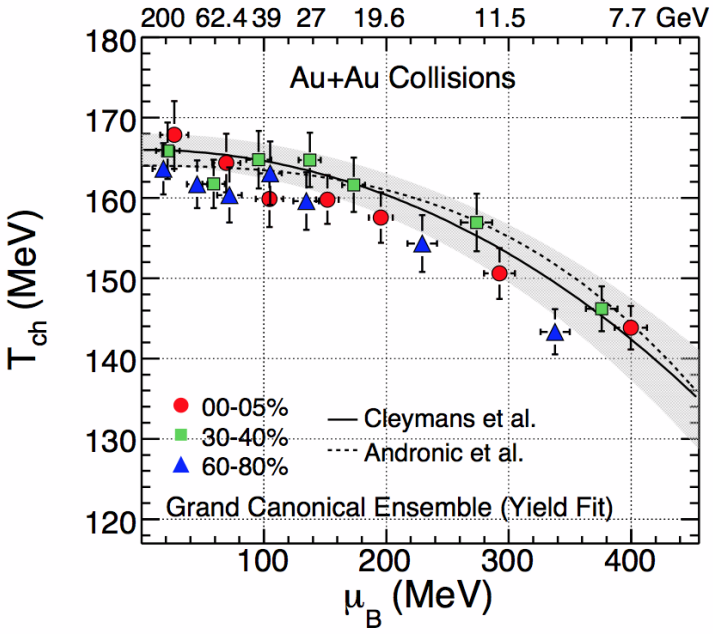


- Anti-hyperon to hyperon ratios are fit well with statistical thermal model
- Chemical freeze-out parameters, μ_S/T_{ch} and μ_B/T_{ch}, are extracted

Chemical freeze-out parameters: T_{ch} vs. μ_B

STAR，Phys. Rev. C 96, 044904, 2017





✓Particles used : π, K, p, Λ, Ξ

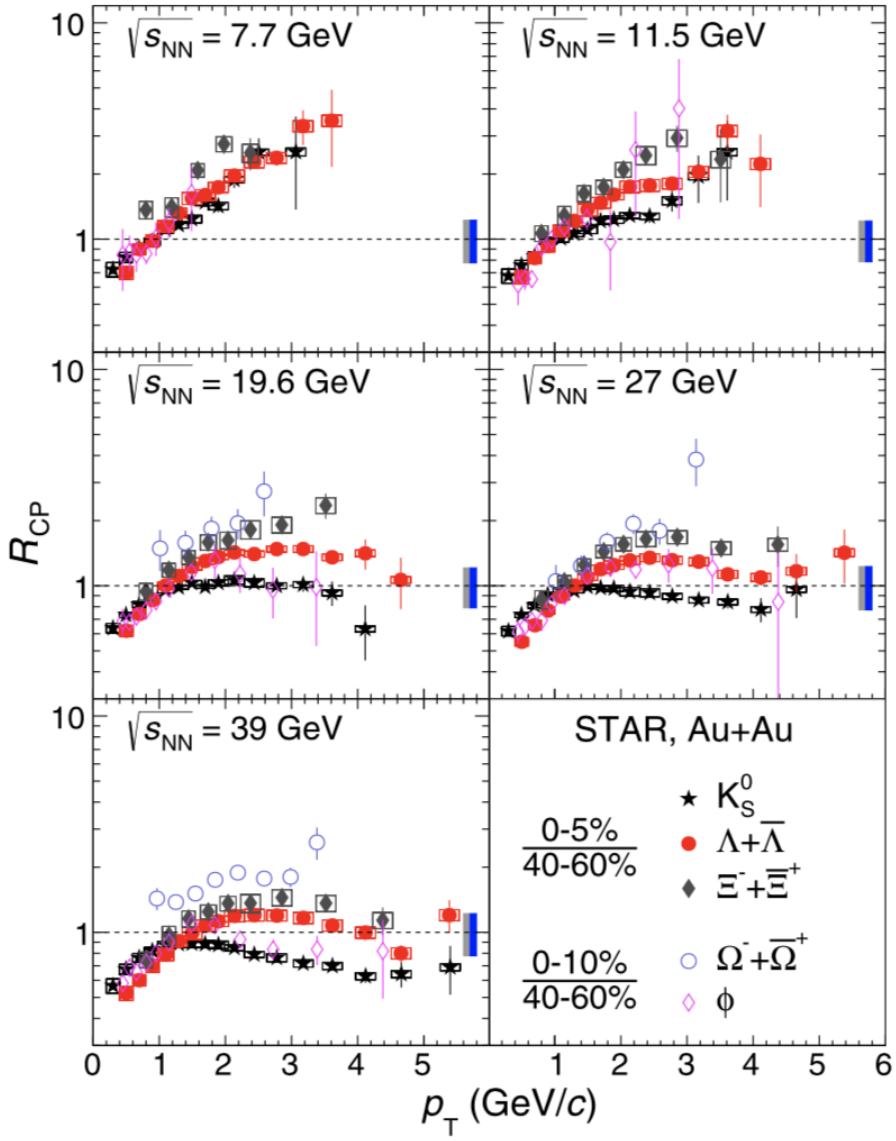
✓ Ensemble used:
Grand canonical (GCE)

✓ Fit parameters:
T_{ch}, μ_B, μ_s and γ_s

Andronic: NPA 834 (2010) 237
Cleymans: PRC 73 (2006) 034905
Au+Au 200 GeV : Phys. Rev. C **83** (2011) 24901

Thermus, S. Wheaton & J. Cleymans, Comput. Phys. Commun. 180: 84-106, 2009.

Nuclear modification factors R_{CP}

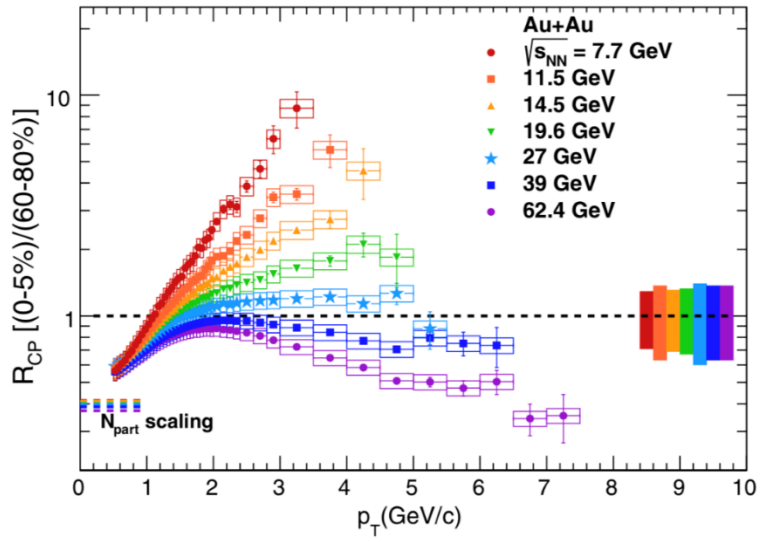


$$R_{\mathrm{CP}}(p_T) = \frac{[d^2\sigma/(N_{\mathrm{bin}} p_T dp_T dy)]_{\mathrm{central}}}{[d^2\sigma/(N_{\mathrm{bin}} p_T dp_T dy)]_{\mathrm{peripheral}}}$$

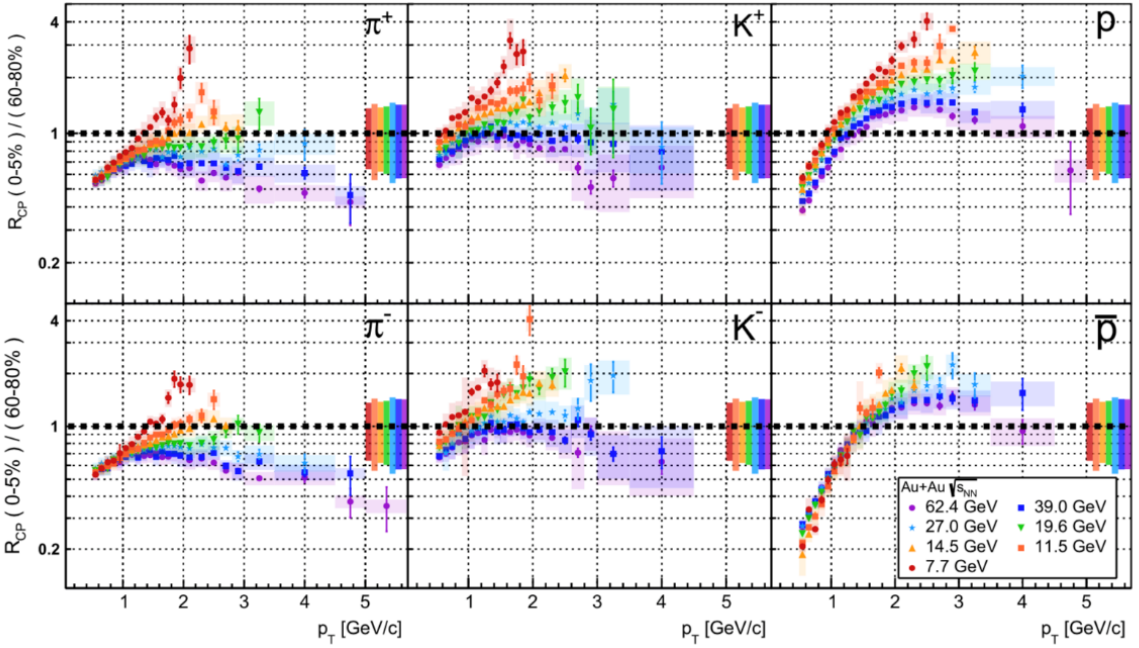
- No K^0_S suppression in Au+Au 7.7 and 11.5 GeV
- Cronin effect and other effects (radial flow) compete with partonic energy loss
- Intermediate p_T, particle R_{CP} difference becomes smaller @ 7.7 and 11.5 GeV

STAR, arXiv:1906.03732

Nuclear modification factors R_{CP}

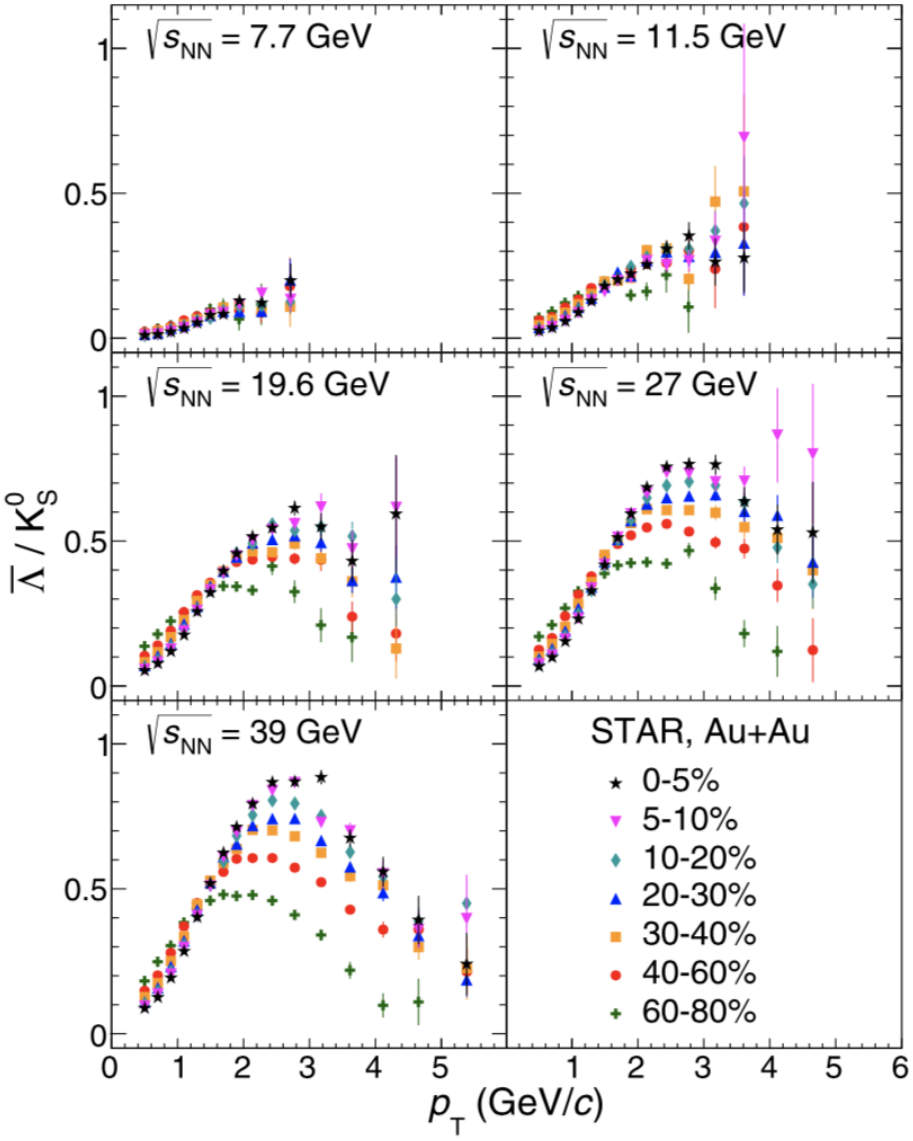


- No suppression for lower energies
- Cronin effect and other effects (radial flow) compete with partonic energy loss



STAR, PRL121, 032301, 2018

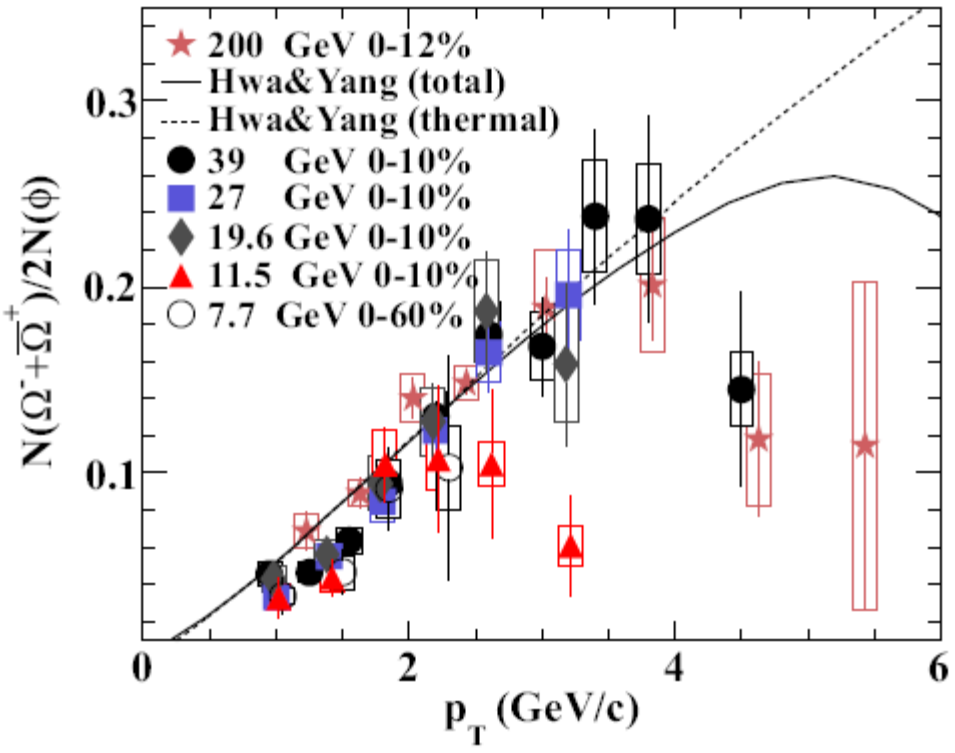
Baryon to meson ratio: $\bar{\Lambda}/K^0_S$

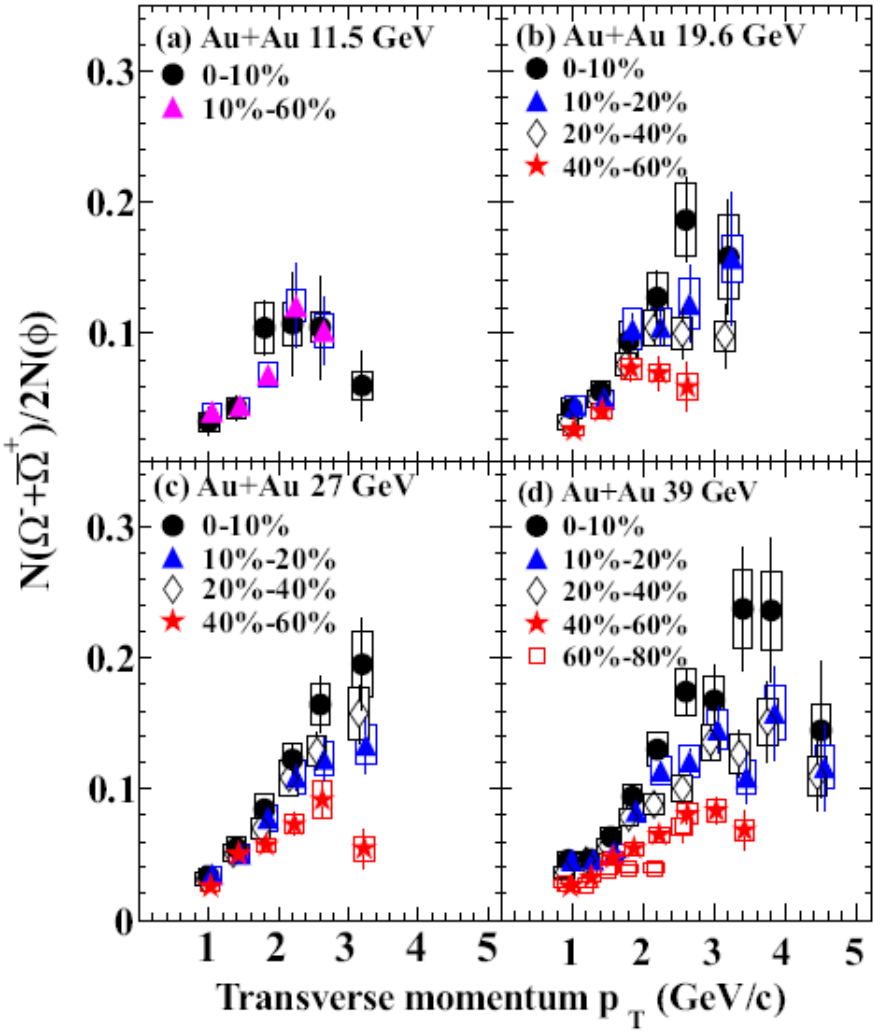


STAR, arXiv:1906.03732

$\sqrt{s_{NN}} < 19.6$ **GeV**, at intermediate p_T, the separation of central (0-5%) and peripheral (40-60%) collisions in $\bar{\Lambda}$ / K^0_S becomes less significant

Ω / ϕ ratio

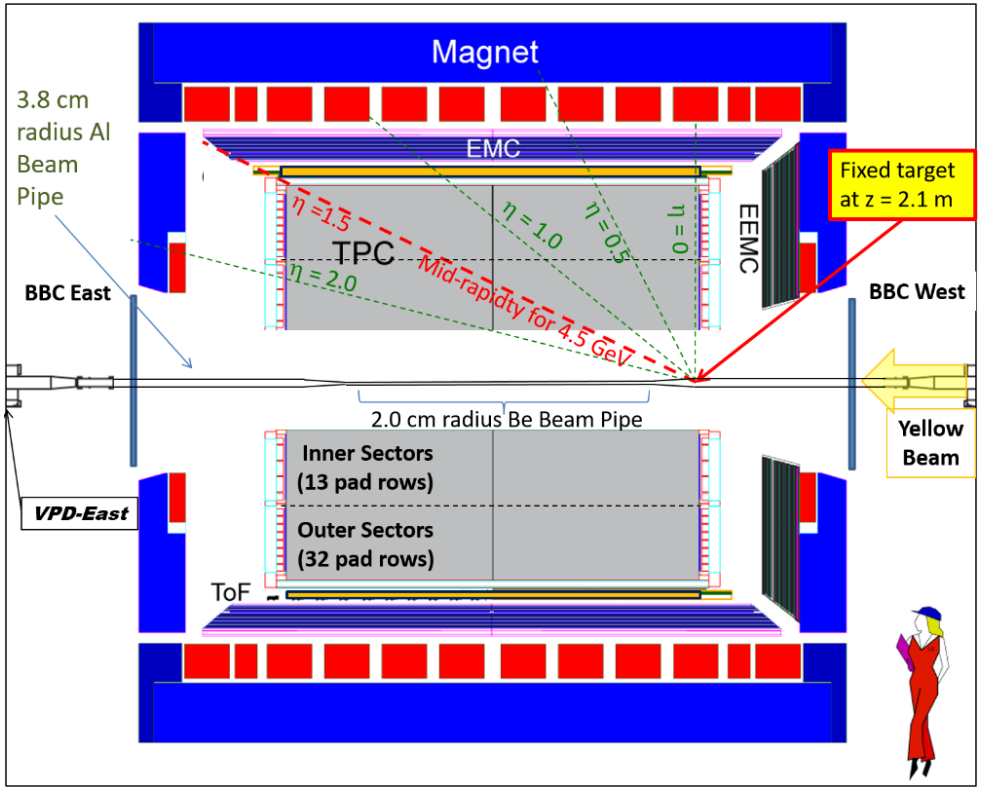




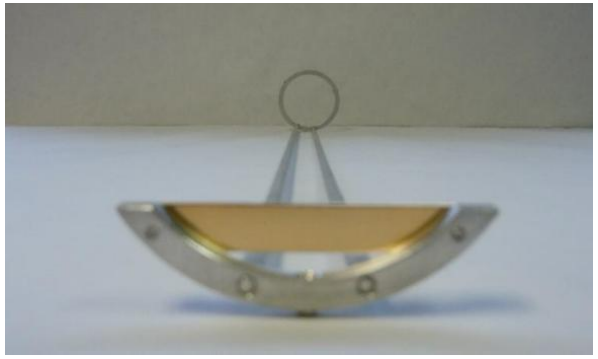
STAR, Phys. Rev. C 93, 021903 (R), 2016

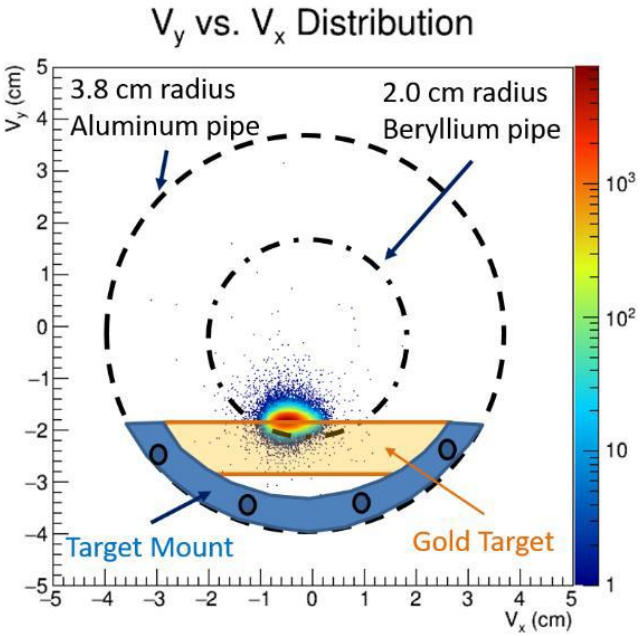
- Intermediate p_T Ω/ϕ ratios:
  Indication of separation between ≥ 19.6 and 11.5 GeV
- Ω/ϕ ratios: 40%-60% peripheral < 0-10% central for 19.6, 27 and 39 GeV

The STAR fixed-target program



A 1 mm thick (4% inter. prob.) gold target

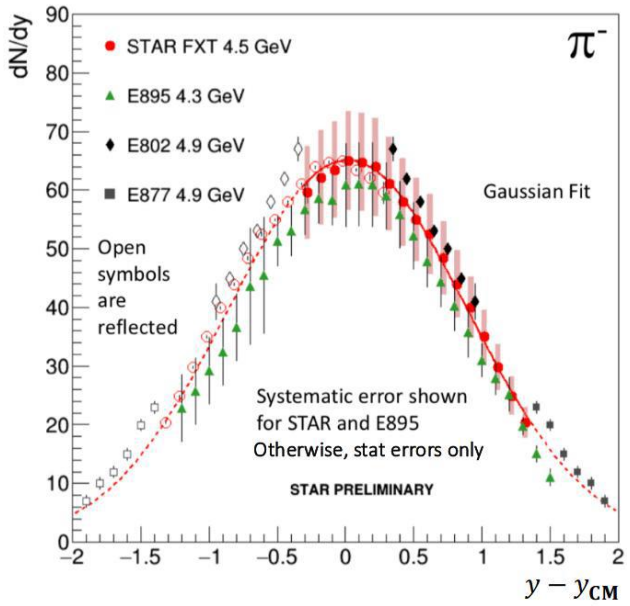




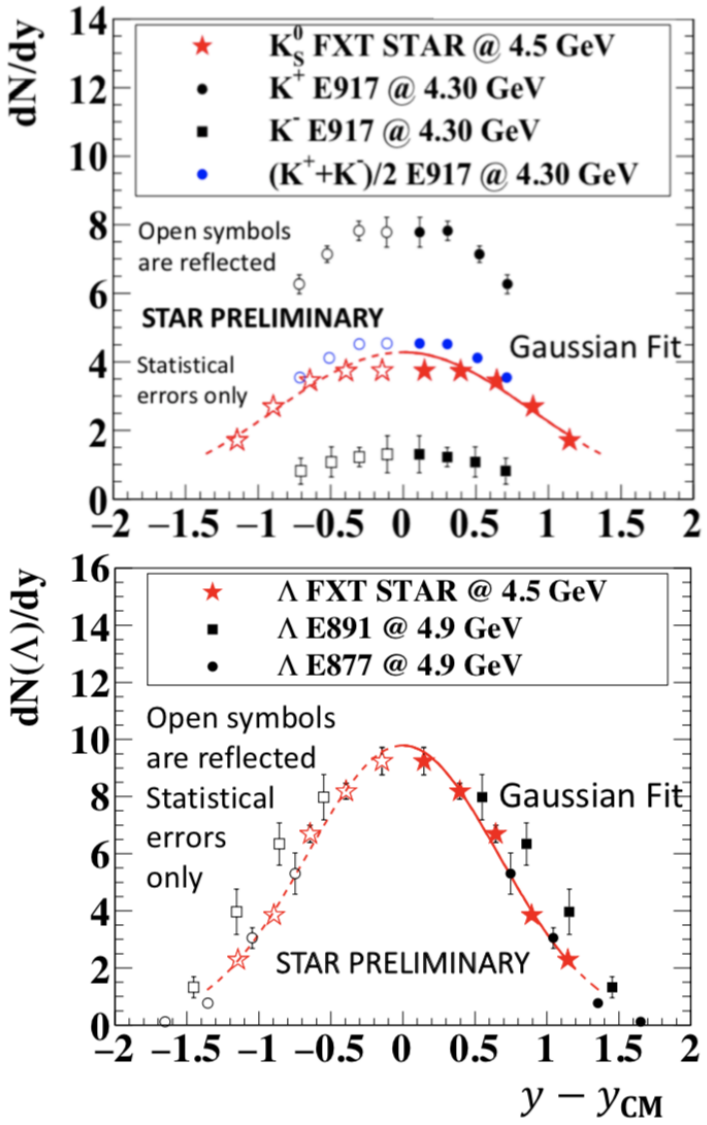
1.3M events from half hour test run, top 30% central trigger, Au+Au $\sqrt{s_{NN}}$=4.5 GeV

3.4M events from two hour test run, top 30% central trigger, Al+Au $\sqrt{s_{NN}}$=4.9 GeV

Hadron spectra and dN/dy in Au+Au $\sqrt{s_{NN}}$=4.5 GeV



E895. Phys. Rev. C 68 (2003) 054905
E802. Phys. Rev. C 57 (1998) R466
E877. Phys. Rev. C 62 (2000) 024901

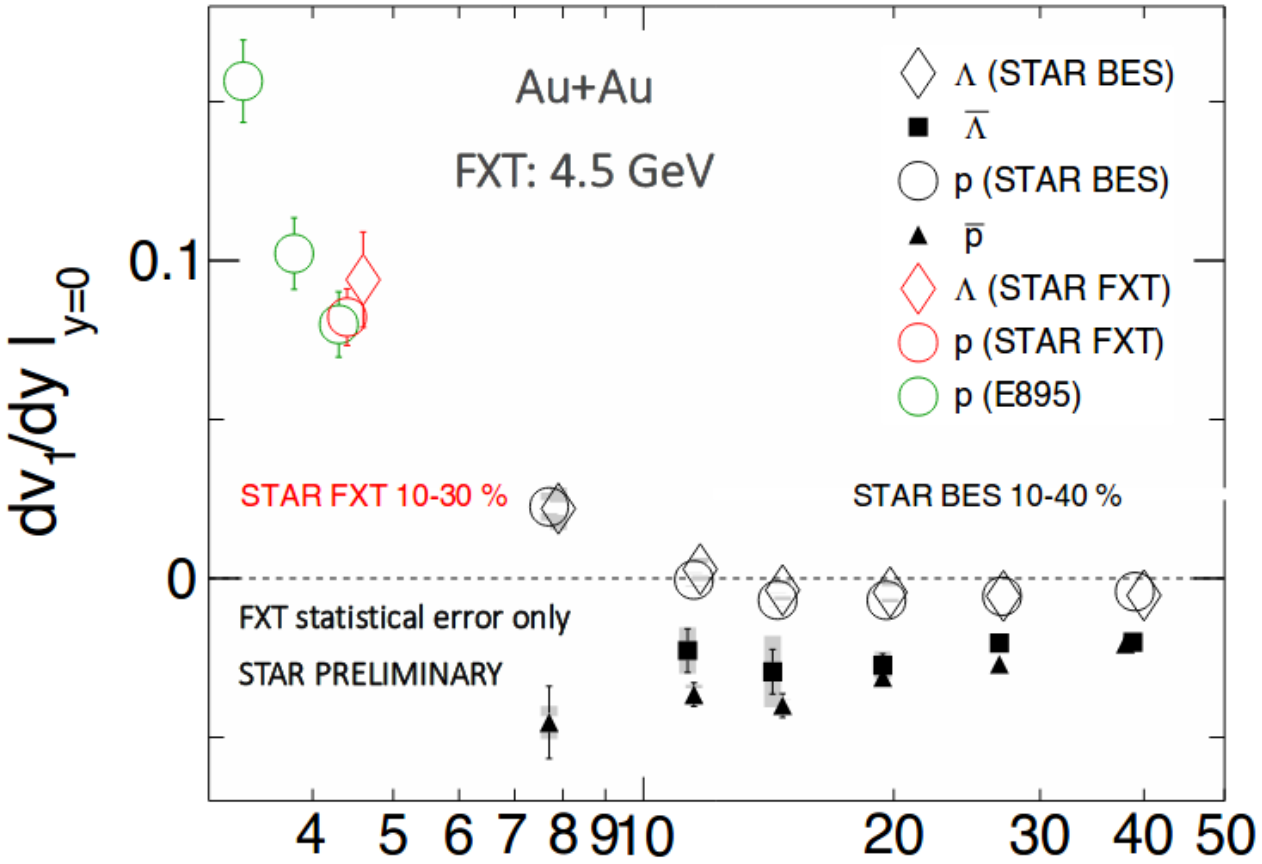


Y. Wu, QM2018
Top 5%

- Amplitude and width of rapidity densities are consistent with AGS experiments
- $m_T - m_0$ and y range will be extended by eTOF and iTPC upgrades

Directed flow in Au+Au $\sqrt{s_{NN}}$=4.5 GeV

E895. Phys. Rev. Lett. 84 (2000) 005488
STAR . Phys. Rev. Lett. 112 (2014) 162301



Y. Wu, QM2018

Baryon v_1 slope is consistent with E895 at 4.3GeV

Summary & outlook

- STAR BES-I have measured systematically the production of strangeness at intermediate baryon density
- Step/horn structures are now investigated at both BES and SPS
- Double sign change seen in directed flow of net-baryons, but not in net-kaons
- QGP signatures appear to turn off at lower collision energies, but need more statistics to confirm
- The ongoing STAR BES-II with detector upgrade (iTPC, eTOF, EPD) and larger luminosity allow precise measurement of the matter properties at intermediate baryon density (μ_B up to 721 MeV)
