Flavour Physics at the High Luminosity LHC: LHCb Upgrade II

Ulrik Egede, Monash University
on behalf of the LHCb collaboration

ICHEP 2020

30 July 2020

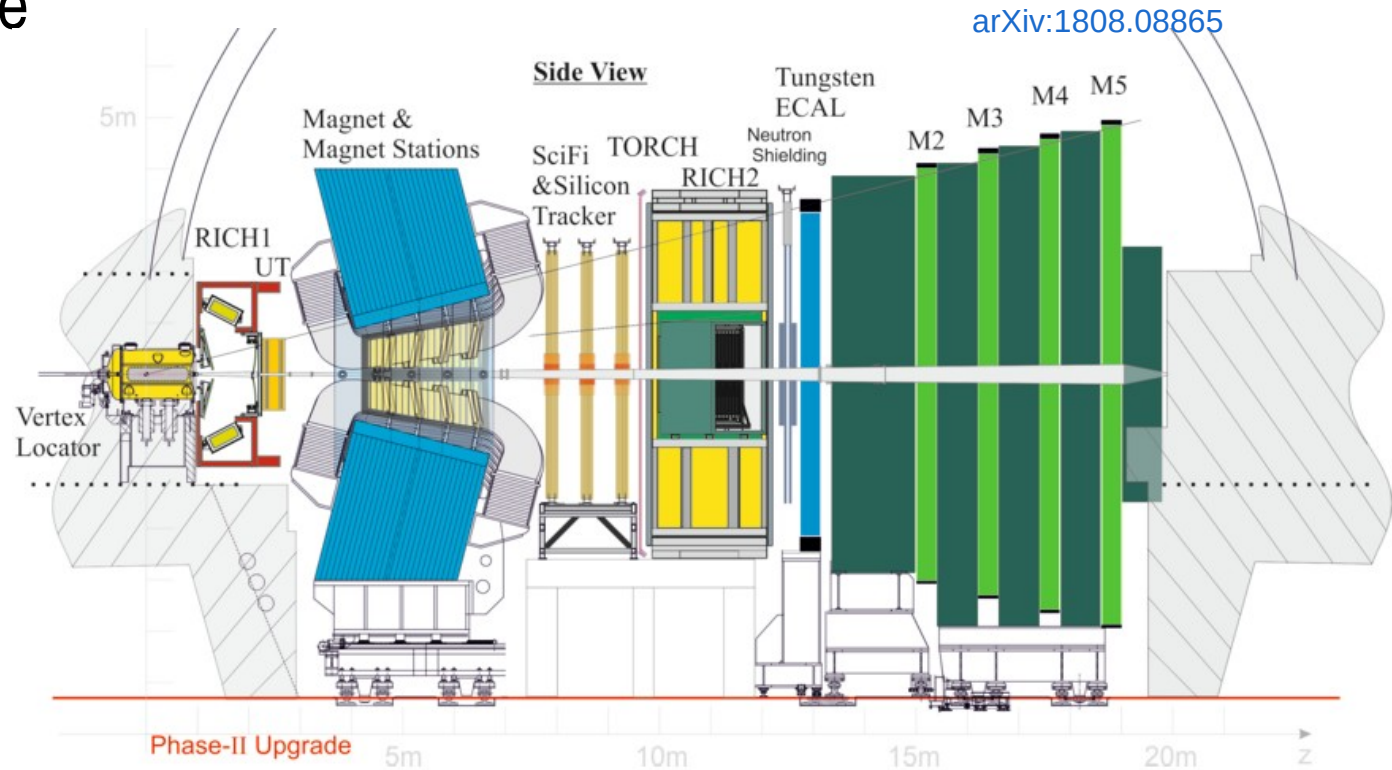

What is LHCb Upgrade II?

- Currently Upgrade I is under installation
- Upgrade II will come online in 2032
- 30 times current integrated luminosity

What is LHCb Upgrade II?

- Upgrade II will involve changes to nearly all parts of experiment
 - Vertexing
 - Hadron PID
 - Tracking
 - Calorimeter
 - Muon system

LHCb Letter of Intent

12 Physics Performance	96
12.1 LHC-B simulation programme	96
12.2 Reconstruction of final states	97
12.2.1 The $B^0(\pi^+\pi^-)$ final state	97
12.2.2 The $B^0(J/\psi K_S)$ final state	101
12.2.3 The $B_s(J/\psi\phi)$ and $B_d(J/\psi K^{*0})$ final states	103
12.2.4 The $B_s(D_s\pi)$ and $B_s(D_sK)$ final state	104
12.2.5 The $B^0(\bar{D}^0 K^{*0})$ Final State	106
12.3 Flavour Tagging	107
12.4 Control Channels and Systematics	109
12.5 The B_s - \bar{B}_s Oscillations	110
12.5.1 Introduction	110
12.5.2 Determination of x_s , τ_s and y_s	110
12.6 CP Sensitivities	111
12.6.1 The angle α	111
12.6.2 The angle β	112
12.6.3 The angle γ Method-1	112
12.6.4 The angle γ Method-2	113
12.6.5 CP violation in $B_s \rightarrow J/\psi\phi$	114
12.7 $B_s \rightarrow \mu^+\mu^-$	115
12.7.1 Reconstruction Simulation	116

- Was written in 1995
- Observation of CP violation in B mesons and B_s^0 oscillations the main selling points
- CP angle γ would mainly be from time dependent analysis of $B_s^0 \rightarrow D_s^+ K^-$
- Charm physics only from $B \rightarrow D/\nu$ decays
- $B_s^0 \rightarrow \mu^+\mu^-$ only rare decay
- Λ_b never mentioned

12.7.1 Reconstruction Simulation	116

- Was written in 1995
- Observation of CP violation in B mesons and B^0 oscillations the selling points
 - Done before start-up*
- CP angle γ would measure from time dependent analysis $B^0 \rightarrow D^+ K^-$
 - Different method*
- Charm physics only from prompt production decays
- $B^0 \rightarrow \mu^+\mu^-$ only decay
- Λ_b not mentioned
 - Vastly expanded*

What does this mean for Upgrade II

- What we think is the main physics right now might not be what we use the detector for
- Discussing physics is good as a method for comparing and contrasting design options
- The variation in the physics we look for is much smaller
- Results from Belle II, ATLAS and CMS might change our goals dramatically

Rare decays

- Current Rare Decay anomalies in $b \rightarrow s \ell^+ \ell^-$ decays can't tell us if we have new physics or if there are charm loop effects that we do not understand
- LHCb upgrade II will allow us to go **from**

Rare decays

- Current Rare Decay anomalies in $b \rightarrow s \ell^+ \ell^-$ decays can't tell us if we have new physics or if there are charm loop effects that we do not understand
- LHCb upgrade II will allow us to go **to**

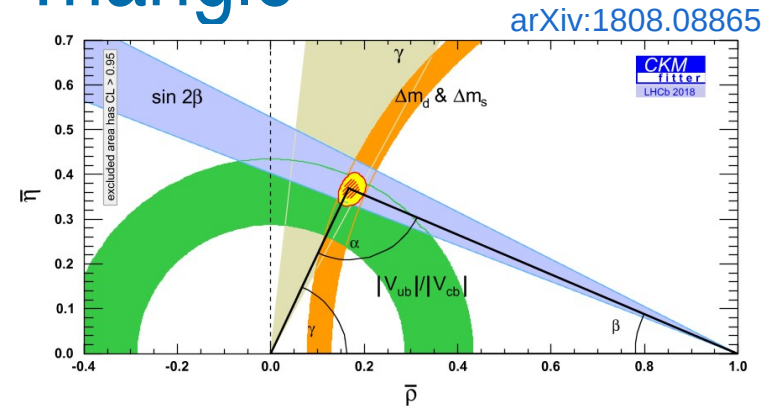

Rare decays

- The “same” NP has to fit all the measurements
- Results here from 2020 consistency analysis of
 - Different decays and observables to same Wilson coefficients
 - Measurement of same Wilson coefficient in different kinematic regions
- Currently just *proof-of-principle* but will be strong constraints with upgrade II when uncertainties go down by \sim factor 5

Constraining the Unitary Triangle

- The “common knowledge” that a measurement of γ is a SM measurement, even in the presence of NP is not at all given
- The Wilson coefficients C_1 and C_2 control the non-leptonic tree level decays
- In reality constraints are no better than constraints on C_9 and C_{10} from penguin decays ...
- Need to constrain Unitary Triangle without any assumptions

Constraining the Unitary Triangle

- Unitary Triangle will impose ever stronger NP constraints

- Two independent measurements of triangle apex
 - $(\Delta m_d/\Delta m_s, \sin 2\beta)$ and (V_{ub}, γ)
 - Both pairs require upgrade II for statistics ($\sin 2\beta$ and γ) and time for theory improvements ($\Delta m_d/\Delta m_s$ and V_{ub})

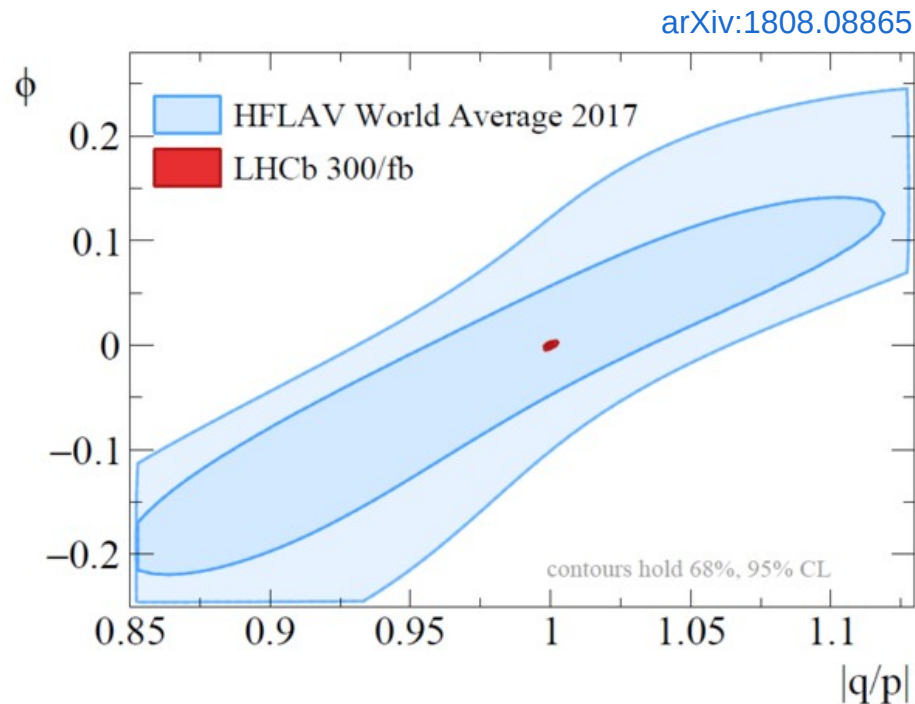

Lepton flavour universality

- Looking for New Physics by comparing decays with muons and electrons a huge challenge
- Calorimeter has to keep current performance with much higher occupancy
- Benefit is in terms of measurements with almost no theoretical uncertainty

Charm CP violation

- Time dependent CP violation in charm serves as an excellent null test for the SM
- Combined with excellent experimental reach this is very promising for upgrade II
- Side stations on magnets for low momentum tracking can improve flavour tagged sample by 20%

Conclusion

- The physics case is strong for Upgrade II of LHCb
 - Refer to [arXiv:1808:08865](https://arxiv.org/abs/1808.08865) for further details
 - A bit like the research plan for a PhD, it should be seen as a possible direction and not a rule book for what we will do
- The theoretical uncertainties are significant in many areas
 - A mixture of improvements in the theory as well as clever data driven cross checks will keep this under control
- LHCb upgrade II plan is ambitious
 - Compromising might mean that we never even realise what gains we can make

Performance table

arXiv:1808.08865

Table 10.1: Summary of prospects for future measurements of selected flavour observables for LHCb, Belle II and Phase-II ATLAS and CMS. The projected LHCb sensitivities take no account of potential detector improvements, apart from in the trigger. The Belle-II sensitivities are taken from Ref. [608].

Observable	Current LHCb	LHCb 2025	Belle II	Upgrade II	ATLAS & CMS
EW Penguins					
$R_K (1 < q^2 < 6 \text{ GeV}^2 c^4)$	0.1 [274]	0.025	0.036	0.007	–
$R_{K^*} (1 < q^2 < 6 \text{ GeV}^2 c^4)$	0.1 [275]	0.031	0.032	0.008	–
$R_\phi, R_{\rho K}, R_\pi$	–	0.08, 0.06, 0.18	–	0.02, 0.02, 0.05	–
CKM tests					
γ , with $B_s^0 \rightarrow D_s^+ K^-$	$(^{+17}_{-22})^\circ$ [136]	4°	–	1°	–
γ , all modes	$(^{+5.0}_{-5.8})^\circ$ [167]	1.5°	1.5°	0.35°	–
$\sin 2\beta$, with $B^0 \rightarrow J/\psi K_S^0$	0.04 [609]	0.011	0.005	0.003	–
ϕ_s , with $B_s^0 \rightarrow J/\psi \phi$	49 mrad [44]	14 mrad	–	4 mrad	22 mrad [610]
ϕ_s , with $B_s^0 \rightarrow D_s^+ D_s^-$	170 mrad [49]	35 mrad	–	9 mrad	–
ϕ_s^{ss} , with $B_s^0 \rightarrow \phi \phi$	154 mrad [94]	39 mrad	–	11 mrad	Under study [611]
a_{sl}^s	33×10^{-4} [211]	10×10^{-4}	–	3×10^{-4}	–
$ V_{ub} / V_{cb} $	6% [201]	3%	1%	1%	–
$B_s^0, B^0 \rightarrow \mu^+ \mu^-$					
$\mathcal{B}(B^0 \rightarrow \mu^+ \mu^-)/\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-)$	90% [264]	34%	–	10%	21% [612]
$\tau_{B_s^0 \rightarrow \mu^+ \mu^-}$	22% [264]	8%	–	2%	–
$S_{\mu\mu}$	–	–	–	0.2	–
$b \rightarrow c \ell^- \bar{\nu}_\ell$ LUV studies					
$R(D^*)$	0.026 [215, 217]	0.0072	0.005	0.002	–
$R(J/\psi)$	0.24 [220]	0.071	–	0.02	–
Charm					
$\Delta A_{CP}(KK - \pi\pi)$	8.5×10^{-4} [613]	1.7×10^{-4}	5.4×10^{-4}	3.0×10^{-5}	–
$A_\Gamma (\approx x \sin \phi)$	2.8×10^{-4} [240]	4.3×10^{-5}	3.5×10^{-4}	1.0×10^{-5}	–
$x \sin \phi$ from $D^0 \rightarrow K^+ \pi^-$	13×10^{-4} [228]	3.2×10^{-4}	4.6×10^{-4}	8.0×10^{-5}	–
$x \sin \phi$ from multibody decays	–	$(K3\pi) 4.0 \times 10^{-5}$	$(K_S^0 \pi\pi) 1.2 \times 10^{-4}$	$(K3\pi) 8.0 \times 10^{-6}$	–
