

Measurements of soft-QCD and diffractive processes with ATLAS

Rafał Staszewski (IFJ PAN Cracow)

on behalf of the ATLAS Collaboration

ICHEP 2020

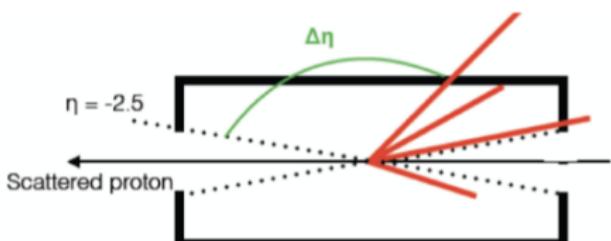

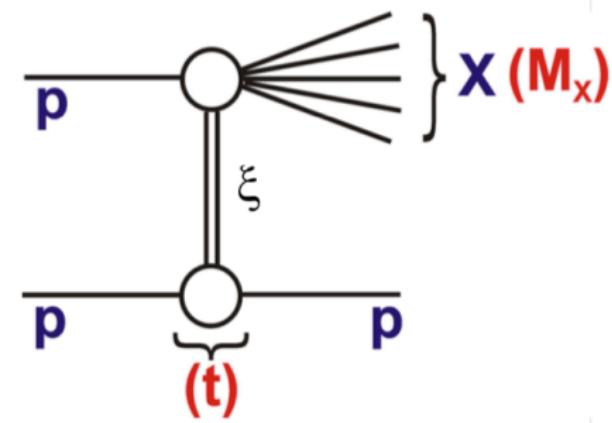

Measurement of differential cross sections for single diffractive dissociation in $\sqrt{s} = 8$ TeV pp collisions using the ATLAS ALFA spectrometer

JHEP 02 (2020) 042

Measurement of distributions sensitive to the underlying event in inclusive Z boson production in pp collisions at $\sqrt{s} = 13$ TeV with the ATLAS detector

Eur. Phys. J. C 79 (2019) 666

Kinematic variables

- t – squared four-momentum transferred from the proton (related to proton transverse momentum)

$$t \approx -p_T^2$$

- ξ – momentum fraction of the proton carried by the pomeron

$$\xi = 1 - E/E_0$$

$$= M_x^2/s \approx \sum_i (E^i \pm p_z^i) / \sqrt{s}$$

E – proton energy

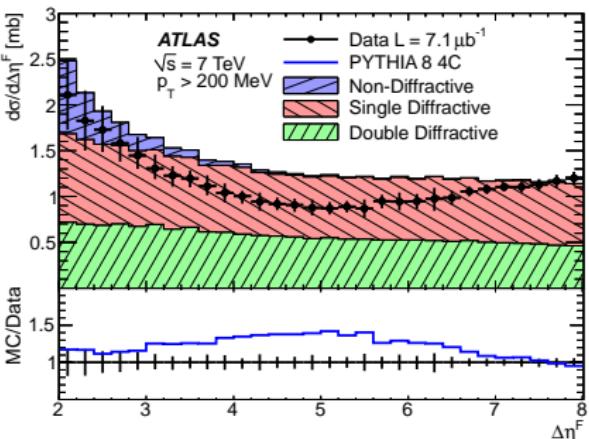

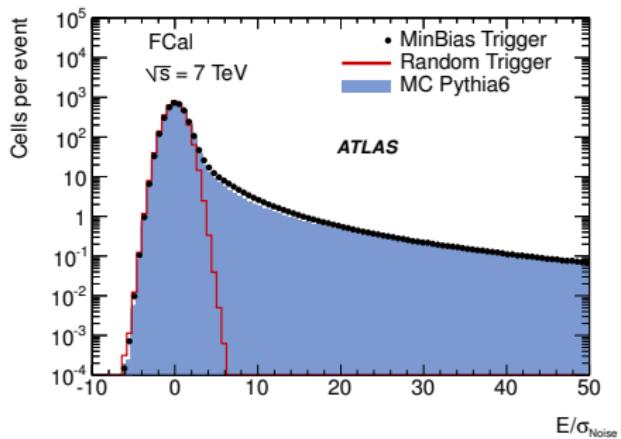

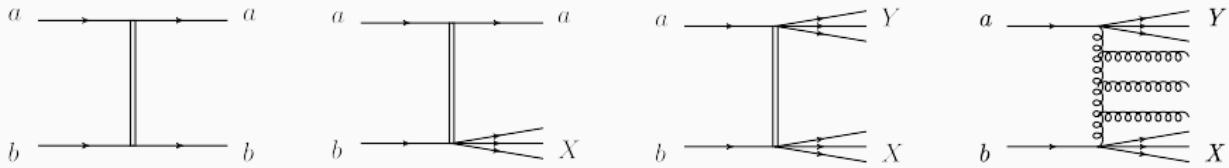

E_0 – proton initial energy

E^i, p_z^i – energy and longitudinal momentum of particles in the dissociated state

s – centre-of-mass energy

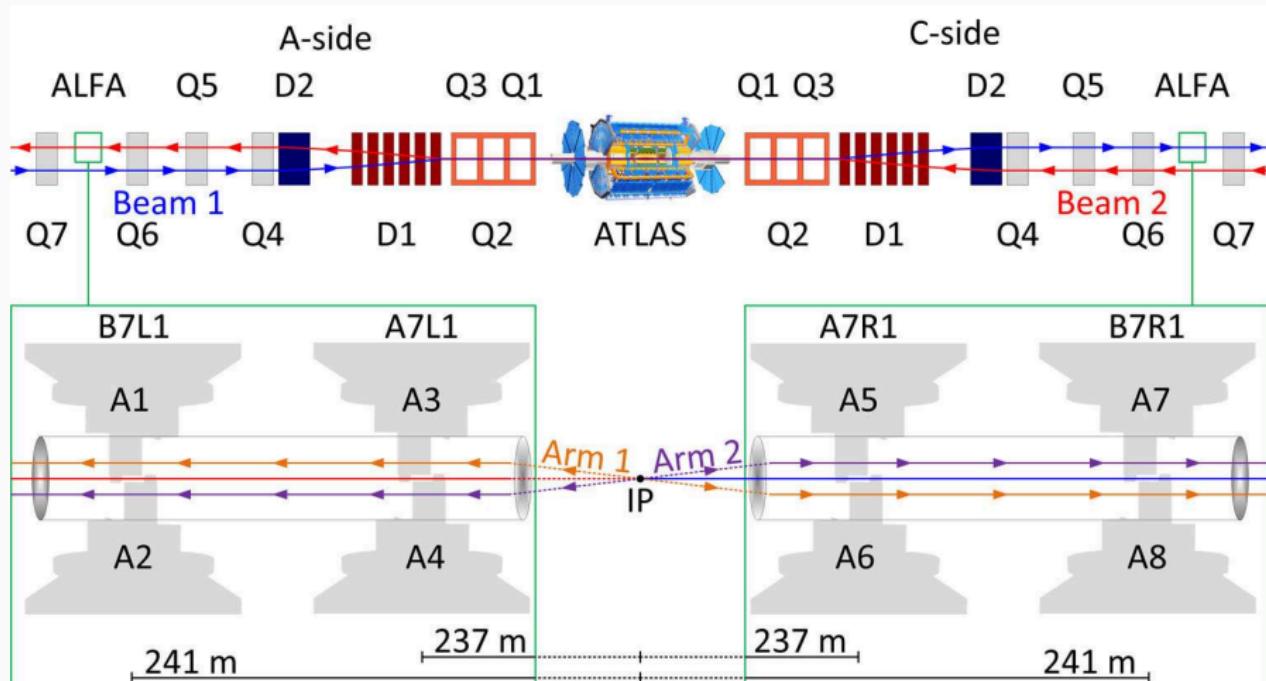

- $\Delta\eta$ – (pseudo)rapidity gap from the tracker edge

Diffraction measurements w/o proton tagging (Eur. Phys. J. C (2012) 72 1926)

- Calorimeter used to measure rapidity gaps
- Separation of diffractive processes from non-diffractive processes
- Full separation of single and double diffraction not possible

ALFA Detectors

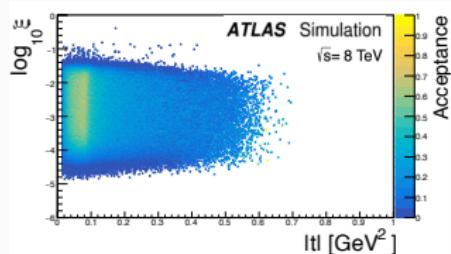

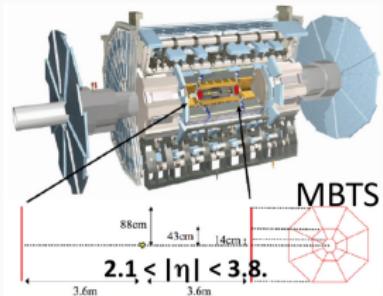

Measurement overview

- Data from special run: $\sqrt{s} = 8 \text{ TeV}$, $\beta^* = 90 \text{ m}$, $L = 1.67/\text{nb}$, $\mu < 0.08$
- Intact proton measured in ALFA
- Dissociated proton measured using ATLAS tracking detector
- Trigger: opposite side coincidence of the signal in ALFA and Minimum Bias Trigger Scintillator (MBTS)
- Acceptance
 - tracker: charged particles with
 - $p_T > 0.2 \text{ GeV}$
 - $|\eta| < 2.5$
 - MBTS: charged particles with $2.1 < |\eta| < 3.8$
 - Fiducial region for the proton

$$0.016 < |t| < 0.43 \text{ GeV}^2$$

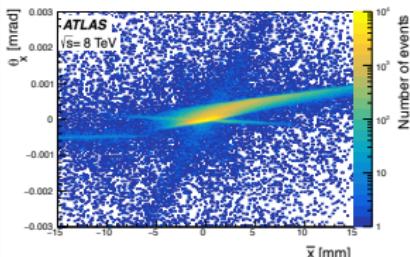

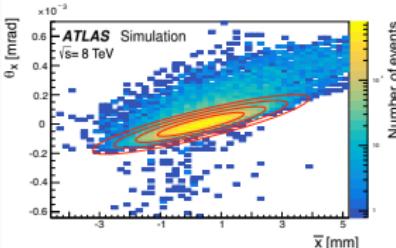

$$-4.0 < \log_{10} \xi < -1.6$$

(i.e. $80 < M_X < 1270 \text{ GeV}$)

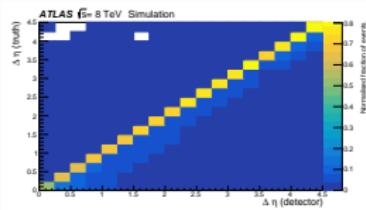

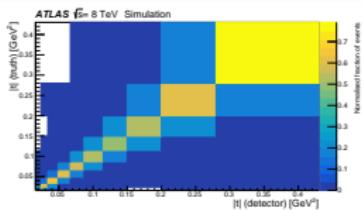

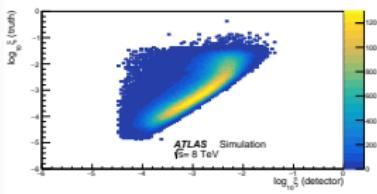

Event selection

- Exactly one reconstructed proton in two ALFA stations of the same armlet
- ALFA: 3σ ellipse cut in (x, θ_x) plane
- ID: at least one track and a reconstructed vertex
- MBTS: at least 5 (out of 16) counters above noise threshold

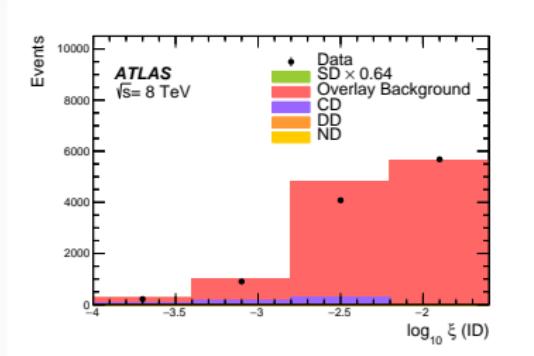

Detector effects

Background

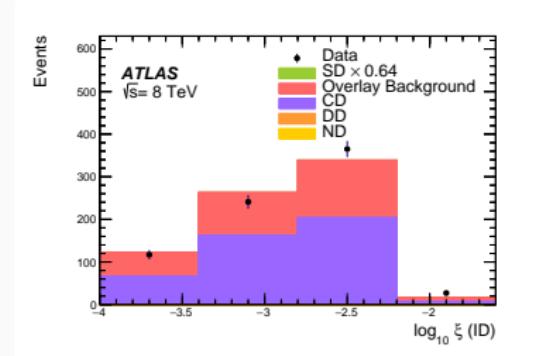

Overlay background

- Coincidence between a proton in ALFA (elastic, halo) and activity in central ATLAS (minimum bias interaction)
- Largest background
- Data-driven estimate using strongly ND-enriched events
- Control region: nominal selection, but with protons in two armlets (dominated by elastics + ND)

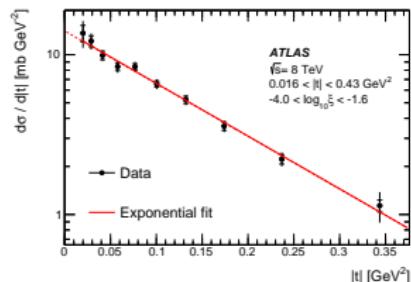

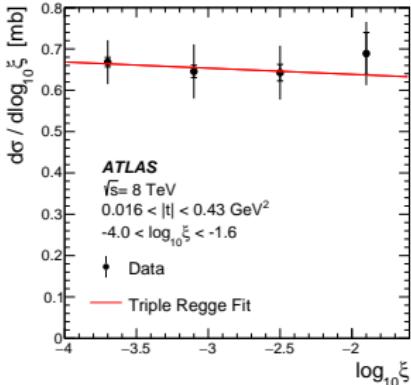

Central diffraction

- Dominant physics background
- Estimated from simulations
- Good description of normalizations and shapes
- Reweighting ξ distributions to match the data, preserving normalization
- Control region: protons in two armlets and 2–10 MBTS segments fired

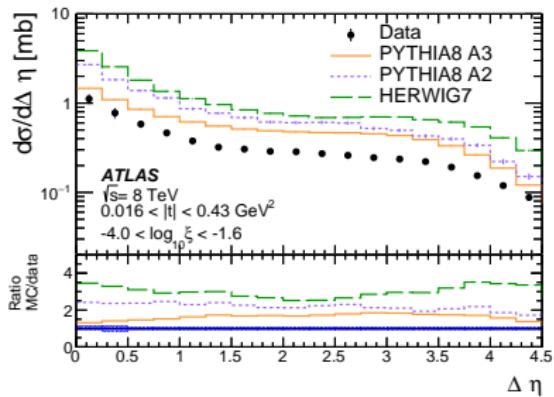

Proton kinematics distribution

- Distribution fitted with:
$$\frac{d\sigma}{d \log_{10} \xi} = \left(\frac{1}{\xi}\right)^{\alpha(0)-1} \frac{\exp(B t_{\text{high}}) - \exp(B t_{\text{low}})}{B},$$
 where $B = B_0 - 2\alpha' \log \xi$
- Measured Pomeron intercept
 $\alpha(0) = 1.07 \pm 0.02 \text{ (stat.)} \pm 0.06 \text{ (syst.)} \pm 0.06 \text{ } (\alpha')$
- Main systematic uncertainty from
 $\alpha' = 0.25 \pm 0.25 \text{ GeV}^{-2}$
- PYTHIA 8 A3 (Donnachie-Landshoff): $\alpha(0) = 1.14$
PYTHIA 8 A2 (Schuler-Sjostrand): $\alpha(0) = 1.00$
- Measured exponential slope:
 $B = 7.60 \pm 0.23 \text{ (stat.)} \pm 0.22 \text{ (syst.) GeV}^{-2}$
- In agreement with Pythia 8 prediction:
PYTHIA8 A2: 7.82 GeV^{-2} , PYTHIA8 A3: 7.10 GeV^{-2}
- Main systematic uncertainty from overlay background subtraction

Integrated cross sections and rapidity gap size

- Unfolded hadron level cross sections after background subtraction
- Diffractive plateau is visible
- Increase at small rapidity gaps: limited acceptance of ATLAS tracker
- Decrease at large rapidity gaps: loss of small- ξ events close to the ξ -edge (10^{-4})

MCs describe the shape but not the overall cross section:

Distribution	$\sigma_{\text{SD}}^{\text{fiducial}(\xi,t)}$ [mb]	$\sigma_{\text{SD}}^{t\text{-extrap}}$ [mb]
Data	1.59 ± 0.13	1.88 ± 0.15
PYTHIA8 A2 (Schuler–Sjöstrand)	3.69	4.35
PYTHIA8 A3 (Donnachie–Landshoff)	2.52	2.98
HERWIG7	4.96	6.11

Measurement of differential cross sections for single diffractive dissociation in $\sqrt{s} = 8$ TeV pp collisions using the ATLAS ALFA spectrometer

JHEP 02 (2020) 042

Measurement of distributions sensitive to the underlying event in inclusive Z boson production in pp collisions at $\sqrt{s} = 13$ TeV with the ATLAS detector

Eur. Phys. J. C 79 (2019) 666

Underlying event

- Complex structure of hadron-hadron interaction
- Underlying event – activity in addition to the hard interaction:
 - initial state radiation
 - final state radiation
 - multiple parton interaction
 - colour reconnections with beam remnants
- Non-perturbative effects
- No clear soft/hard separation
- Phenomenological model in MC generators
- A need for tuning models to experimental data

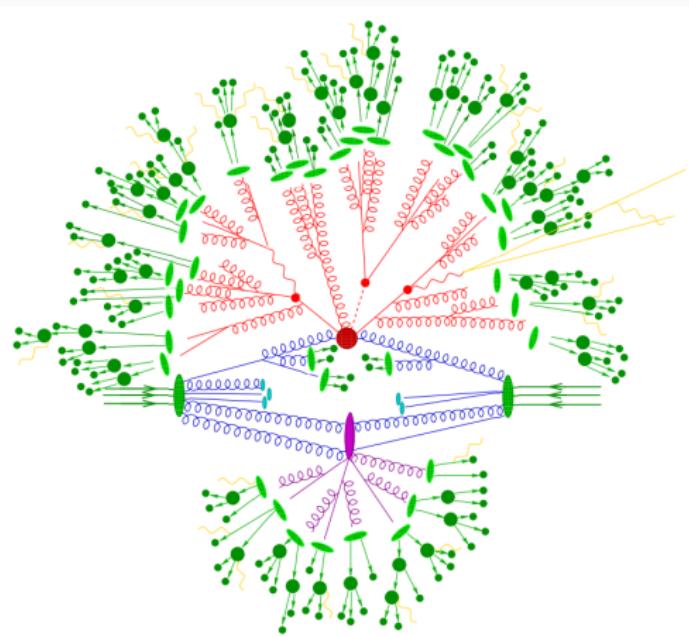

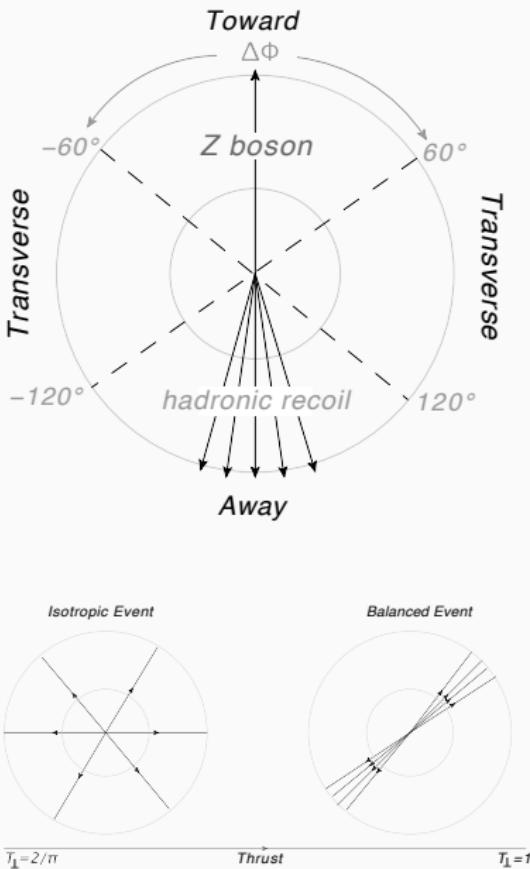

Figure from [arXiv:1411.4085]

Measurement overview

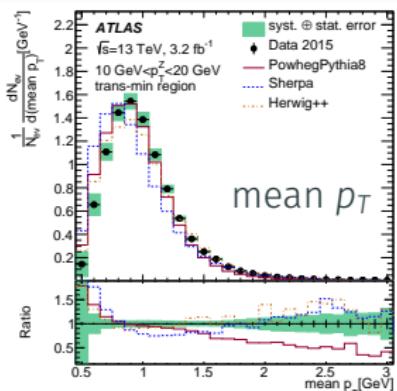

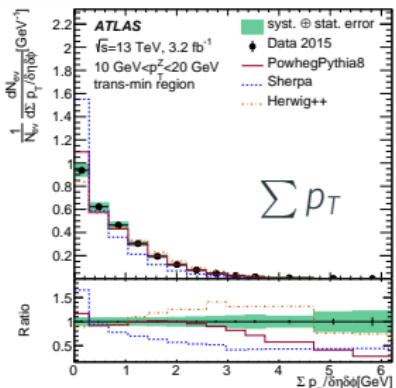

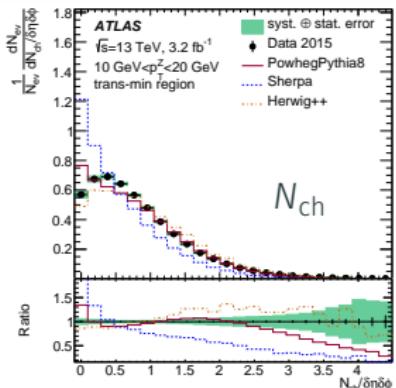

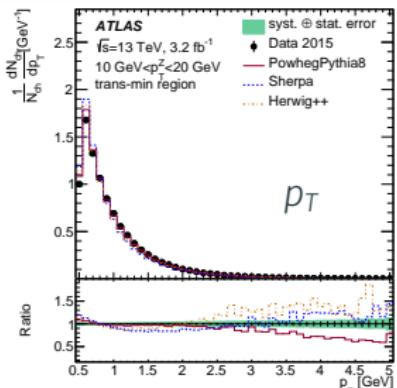

- Selecting $Z \rightarrow \mu\mu$ events
- Regions in the transverse plane defined relative to the Z direction
- Observables:
 - number of charged particles
 - p_T of charged particles
 - $\sum p_T$ of charged particles
 - mean p_T of charged particles
- Two transverse regions: *trans-min* and *trans-max* (defined based on $\sum p_T$)
- Measurements in different regions, in bins of Z transverse momentum and bins of transverse thrust

Transverse thrust:

$$T_{\perp} = \max_{\hat{n}} \frac{\sum_i |\vec{p}_{T,i} \cdot \hat{n}|}{\sum_i |\vec{p}_{T,i}|}$$

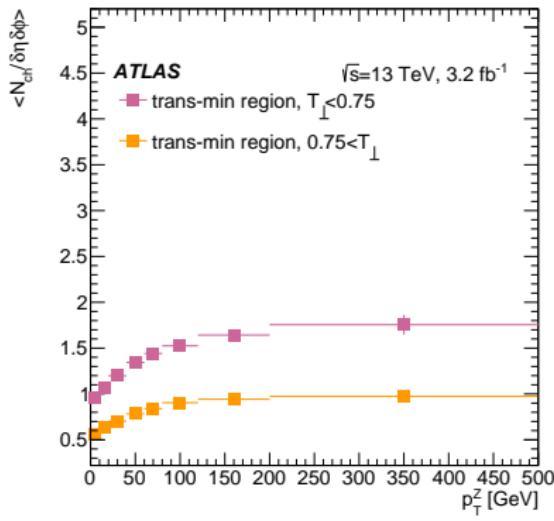

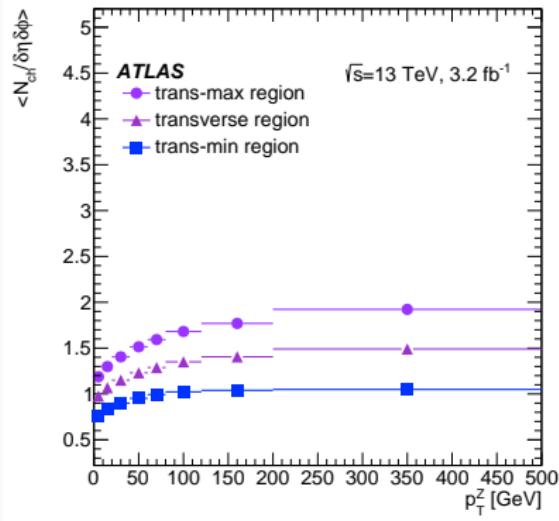

(sums are over all charged particles except the two muons from Z decay)

Distributions of different observables

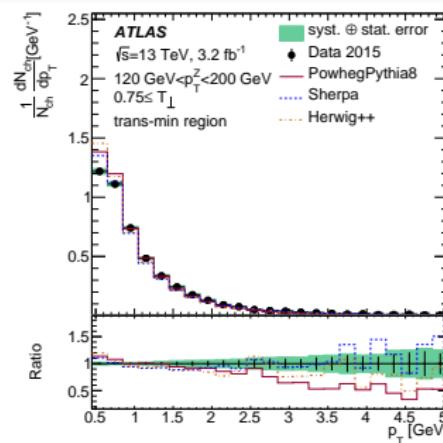

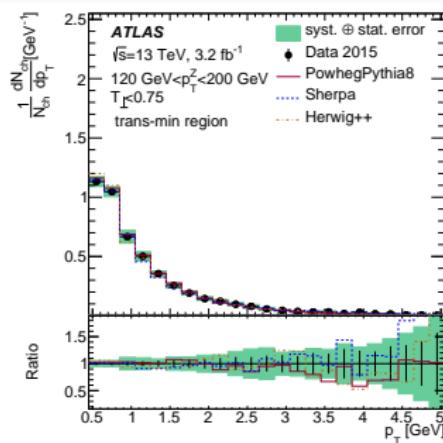

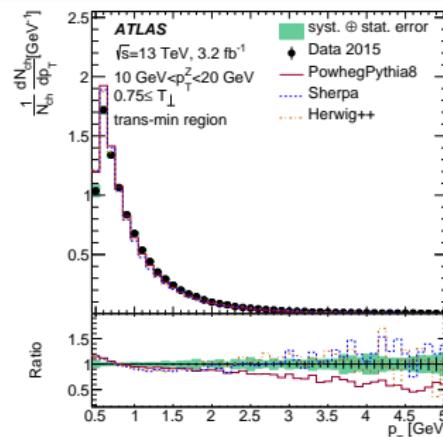

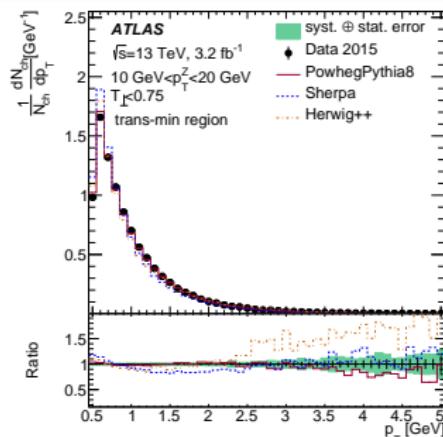

- All distributions corrected for detector effects
- None of the tested MC describes the data well
- All observables not well described
- Too steep p_T distribution in MC models
- Input for MC tuning

Dependence on region, transverse momentum, thrust

- Activity grows with p_T^Z , the growth slows down with p_T^Z
- Significant difference between trans-min and trans-max regions (trans-max more affected by the hadronic recoil of the Z boson)
- Higher activity in low-thrust events

Distributions for different p_T^Z and thrust

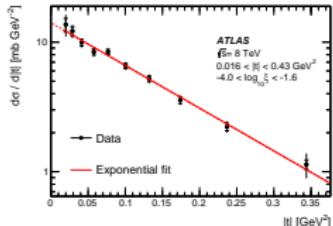

Summary

1. Measurement of single diffractive dissociation with a proton tag

- Fiducial cross section over predicted by MC generators
- Extracted parameters describing proton distributions:

$$B = 7.60 \pm 0.23 \text{ (stat.)} \pm 0.22 \text{ (syst.)} \text{ GeV}^{-2}$$

$$\alpha(0) = 1.07 \pm 0.02 \text{ (stat.)} \pm 0.06 \text{ (syst.)} \pm 0.06 \text{ } (\alpha')$$

2. Measurement of UE-sensitive observables in Z events

- four different observables studied
- measurements in different regions, in several transverse momentum and thrust bins
- important input for tuning MC generators
