Generating the full SM at linear colliders

Mikael Berggren¹

¹DESY, Hamburg, On behalf of the generator group (LCGG) of the Linear Collider Collaboration (LCC)

40th International Conference on High Energy Physics, Prague, Czech republic , July 27 - August 6, 2020

Outline

Linear colliders

Generating the full SM

- Process classification
- Physics generator
- Generating beam properties
- Setup, integration, event generation, documentation

Outlook

< ロ > < 同 > < 回 > < 回 >

Outline

Generating the full SM

- Process classification
- Physics generator
- Generating beam properties
- Setup, integration, event generation, documentation

Conclusions

Disclaimer

This is not a talk about physics in event generators, nor about detector simulation.

A B b 4 B b

Linear colliders

- polarised e^+e^- colliders with $E_{CMS} = (90)-250 3000$ GeV.
- e^+e^- means EW-production \Rightarrow Low background.
 - Detectors w/ $\sim 4\pi$ coverage.
 - Rad. hardness not needed: only few $\% X_0$ in front of calorimters.
 - No trigger
- e^+e^- means colliding point-like objects \Rightarrow initial state known

Linear colliders

- polarised e^+e^- colliders with $E_{CMS} = (90)-250 3000$ GeV.
- e^+e^- means EW-production \Rightarrow Low background.
 - Detectors w/ $\sim 4\pi$ coverage.
 - Rad. hardness not needed: only few % X₀ in front of calorimters.
 - No trigger
- e^+e^- means colliding point-like objects \Rightarrow initial state known

ILC:

- 20 year running → 4 ab⁻¹ @ 500 GeV, 2 ab⁻¹ @ 250 GeV.
- Construction under political consideration in Japan.

20 year running → 5 ab⁻¹ @ 3
 TeV, 2.5 ab⁻¹ @ 1.5 TeV, 1
 ab⁻¹ @ 380 GeV.

Possible future CERN project.

- 3

- Future LCs aim for extremely high precision measurements.
 - ⇒ Need excellent detector, well controlled machine conditions
 But also the best possible estimate of backgrounds.
- MC statistics or lacking channels must not be a major source of systematic errors ⇒
 - All SM channels yielding at least a few events under the full lifetime of the projects need to be generated, with statistics largely exceeding that of the real data.
 - Also machine conditions need to be accurately taken into account.
- In addition: at an LC ALL events are interesting, and often fully reconstructed. More like a B-factory than LHC!
- This endeavour has been organised as a common effort between ILD and SiD at ILC and CLICdp at CLIC. The work is done within the generator group, LCGG.

Generate the full SM? What's the problem?

- Just select a generator, and press <RET>, right?
- Noooo..., not really. Lots of details:
 - What collides ($e^{+/-}$ or γ ?)
 - What energy do they have, and how are they polarised ??
 - Where do they collide ?
 - Beam-spot properties
 - What else happens?
 - Beam-strahlung gives pairs
 Do they bit anything ? Maybe forward calorimetry, or the tracking system?
 - Multiple interactions (pile-up) 2:

In addition, the physics channels themselves:

- At an LC, ALL events are interesting !
- Huge spread in cross-sections
- But for any given study, it might be a tiny cross-section one that dominates...
- ... or maybe a tiny fraction of a huge cross-section one.
- We want to make nice stacked histos of different backgrounds different from analysis to analysis.
- ⇒ Good idea to separate channels in an intelligent and well documented way

Mikael Berggren (DESY)

40th ICHEP, Jul-Aug 2020 6/16

- Initial state
 - $\bullet~$ ee, e $\gamma~{\rm or}~\gamma\gamma$
 - e polarisation and γ type (real or virtual)

• Final state

- Number of fermions (1 to 8)
- Flavour-grouping: W or Z, or ambiguous
- leptonic, hadronic, semi-leptoni (+ neutrino only, for Z-leptonic)

Special considerations

- Eg. 4f with |L_e|=2 ⇒ dominated by single W or single Z (t-channel !)
- Avoid double-counting: Eg. γ^{*}γ^{*} → ff̄ vs. e⁺e[−] → θ⁺θ[−]f̄

- Initial state
 - $\bullet~$ ee, e $\gamma~$ or $\gamma\gamma$
 - e polarisation and γ type (real or virtual)

• Final state

- Number of fermions (1 to 8)
- Flavour-grouping: W or Z, or ambiguous
- leptonic, hadronic, semi-leptoni
 (+ neutrino only, for Z-leptonic)

Special considerations

- Eg. 4f with |L_e|=2 ⇒ dominated by single W or single Z (t-channel !)
- Avoid double-counting: Eg. γ^{*}γ^{*} → ff
 vs. e⁺e⁻ → e⁺e⁻f

- Initial state
 - $\bullet~$ ee, e $\gamma~{\rm or}~\gamma\gamma$
 - e polarisation and γ type (real or virtual)

• Final state

<u>Whizard</u> is the generator of choice for e^+e^-

- Full matrix-element evaluation. Only at tree-level but:
 - Polarised beams.
 - Full helicity treatment.
 - Full colour flow, passed from the hard interaction to the P.S. code.
 - Can handle beam-spectrum, using <u>Circe2</u>.
 - Can handle polarised *τ*-decays, using TAUOLA [Comp Phys Comm,64,p275].
 - And: Can do 2 \rightarrow 8 processes.
- ... which is more important than NLO for e⁺e[−] ! That was just one 5f tree-level diagram of ~ 500...

э

- The subsequent parton-shower and hadronisation is done by <u>PYTHIA6.4</u>.
 - LCGG has tuned hadronisation using input from OPAL at LEPII [Phys.Rept. 291 (1997) 107-217, D. Ward, private communication.].
- The process-definition given in the Whizard steering file (aka the *sindarin*) is also the driver for the scripts that organises the production: One ring to rule them all.
- Use powerful grouping and aliasing capabilities of sindarin to assure that no processes are over-looked.

- Beam-spectrum.
 - Incoming beam-spread
 - 2 But also: very strongly focused beams ⇒ Beam-beam interactions
- Photons
 - How many photons?
 - Are they virtual or real?
- Need beam-beam interaction simulation input.
- Simulate interaction region: GuineaPig [CERN-PS-99-014-LP]. Gives:
 - Beam-spectrum for electrons and positrons independently
 - Amount and spectrum of real photons

イロト イヨト イヨト イヨト

40th ICHEP, Jul-Aug 2020 10/16

- Beam-spectrum.
 - Incoming beam-spread

 - Distribution of interaction point

Two types:

- Pair-background: Pair-creation of photons in the beam by the strong fields. GuineaPig can generate the full activity during a beam-crossing (a "BX").
- low-p_{\perp} hadrons, ie. $\gamma^{(*)}\gamma^{(*)}$ interaction with small $M_{\gamma\gamma}$ and multiplicity. NB: only $\mathcal{O}(1)/BX$!
 - ME can't do this, and PYTHIA is good down to M_{γγ} ~ 2 GeV.
 - Below: fit to data Custom generator developed by LCGG.
- Both types: Pre-generate pool of events, pick at random and overlay on main event.

 For pairs: Do ~ 10° BXes, use fast detector simulation <u>SGV</u> to filter out track hitting tracking (~10/BX), rest used to build a map of background on BeamCal.

Setup & integration

- Whizard process definition is parsed to build a directory-tree structure one unique directory per process.
- Process-specific code is generated and compiled (interactive)
- The tree is traversed to do a "pre-integration" of all channels, to flag zero cross-section ones (interactive).
- Full integration of all channels, with error goal 0.1 % submitted (local batch-farm under Condor). Over-night for ≤ 5f.
- Pilot generation of all channels, (1k events/channel), to evaluate CPU time and storage needed.

3

Setup & integration

- Whizard process definition is parsed to build a directory-tree structure - one unique directory per process.
- Process-specific code is generated and compiled (interactive)
- The tree is tray At this point, the system is all channels, to flag zero cross ready to generate the full SM
- Full integration or an channels, with error goar 0.1 % submitted (local batch-farm under Condor). Over-night for ≤ 5f.
- Pilot generation of all channels, (1k events/channel), to evaluate CPU time and storage needed.

Generation

- Done on a batch-farm.
- In most cases: one process per generation job.
- Some processes alone represent ~ billion events. These must be split in several jobs.
- At the end of each job, the events (in <u>LCIO</u> format), metadata, and input+logfile tarballs are uploaded to the grid, where the simulation and reconstruction system under <u>DIRAC</u> kicks in details in talk of R. Ete in this track on Friday.
- At this point, disk can be freed on the batch cluster (otherwise disk-space might become an issue).

Created by generation job, driven by the contents of the processdefinition Sindarin script and common conditions. It goes into:

- The event header:
 - · Process-id, beam-polarisation, and cross-section of each event.
- The generator meta-data files:
 - Condenses job-specific information from Whizard logs.
 - Contains: process, cross section, polarisation, file-names, ...
 - Browasble on the Web and uploaded to the Grid.
 - Once on the grid, the metadata is read by DIRAC to orchestrate the detector simulation.
- Steering-files, logs, pdf:s with diagrams, integration grids, output other than the events,...:
 - On the Web, in full.
 - In tar files parallel to generated files, also stored on the Grid.

Outlook

Future tasks

Soon: massive generation for ILC@250, with latest ILC parameters

- $\mathcal{O}(10)$ times more than the DBD, more than expected real data.
 - For \leq 5f: CPU \sim 20000 h Disk \sim 10 TB : Much, but not too much...
 - Using $\mathcal{O}(100)$ cores, this generation is done in 1 to 2 weeks.

Whizard developments

• gluon matching between ME and PS:

- Now: no gluons included in ME (setting $\alpha_s = 0$) to avoid
 - double-counting with (unmatched) parton shower in PYTHIA.
- Whizard 2 does parton-shower with "MLM matching". Exploit this !
- Medium-term wishes for Whizard:
 - γ ISR/FSR matching
 - Work out priority processes for EW-NLO (!)

In general it would be nice to also have other generators

- BHWide for better Bhabhas. BDK/BDKRC for $\gamma\gamma \rightarrow \ell\ell$
- Pythia8, MadGraph, Sherpa for double-checks.
- Pythia8 instead of Pythia6 for hadronisation

Outlook

- We have explained that the precision-goal of future e⁺e⁻ colliders are such that it is not permissible that MC statistics or coverage could constitute an major systematic uncertainty.
- We showed how the generation of the full SM can be achieved.
 It consists of bringing a large number of different codes together:
- This full data is organised and documented in a physics-oriented fashion, for the benefit of the end-user.
- The entire system pivots around one data-source, the Whizard process definition file.

Conclusions

- We have explained that the precision-goal of future e⁺e⁻ colliders are such that it is not permissible that MC statistics or coverage could constitute an major systematic uncertainty.
- We showed how the generation of the full SM can be achieved.
 - It consists of bringing a large number of different codes together:
 - Whizard, Pythia, and Tauola for physics generation
 - GuineaPig and Circe2 for beam-properties
 - SGV+GuineaPig and the Peskin/Barklow generator for pile-up
 - In addition, input from machine-physics and data from LEPII was used.
- This full data is organised and documented in a physics-oriented fashion, for the benefit of the end-user.
- The entire system pivots around one data-source, the Whizard process definition file.
