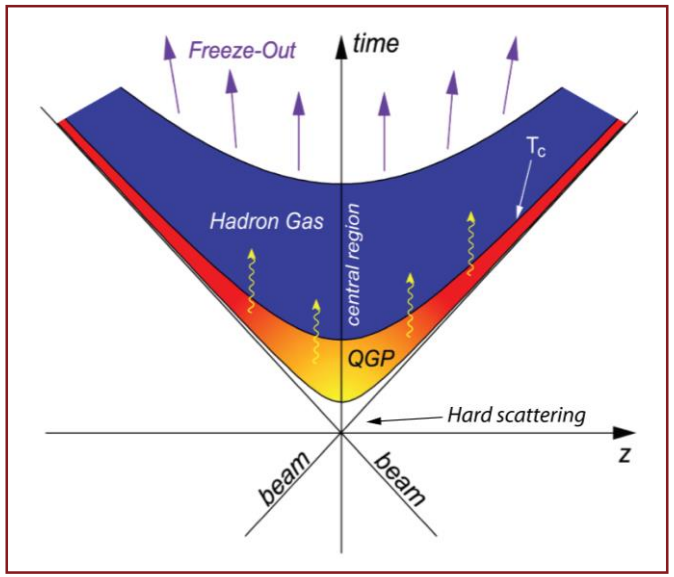
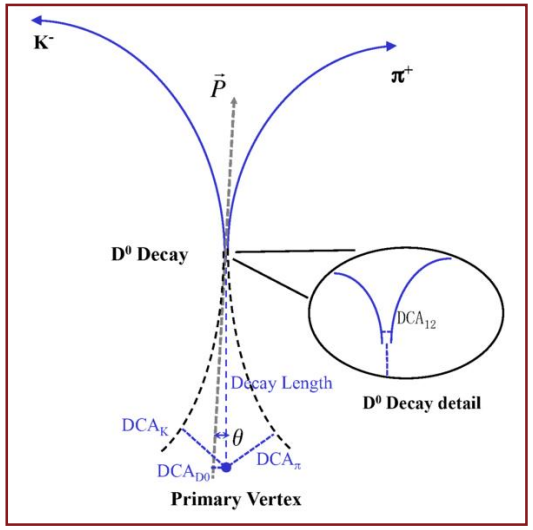
Outline

- Motivation – probing quark-gluon plasma
- The Solenoid Tracker At RHIC
- Heavy flavor energy loss in Au+Au collisions
- Directed and elliptic flow of charm quarks in Au+Au collisions
- Hadronization of charm quarks in Au+Au collisions

Heavy-flavor quarks as a probe of quark-gluon plasma (QGP)

- QGP is hot and dense medium produced in **heavy-ion collisions**
- HF quarks possess **large masses**
  → they are produced primarily at the **early stages of nuclear collisions**
  → they experience the **whole evolution of the system including the QGP phase**
- HF hadrons allow to probe **the quark mass dependence of energy loss** in the QGP
- **Collective behavior** of heavy-flavor quarks
  → sensitive to the degree of thermalization in the QGP
  → constrain the heavy-flavor quark diffusion coefficient



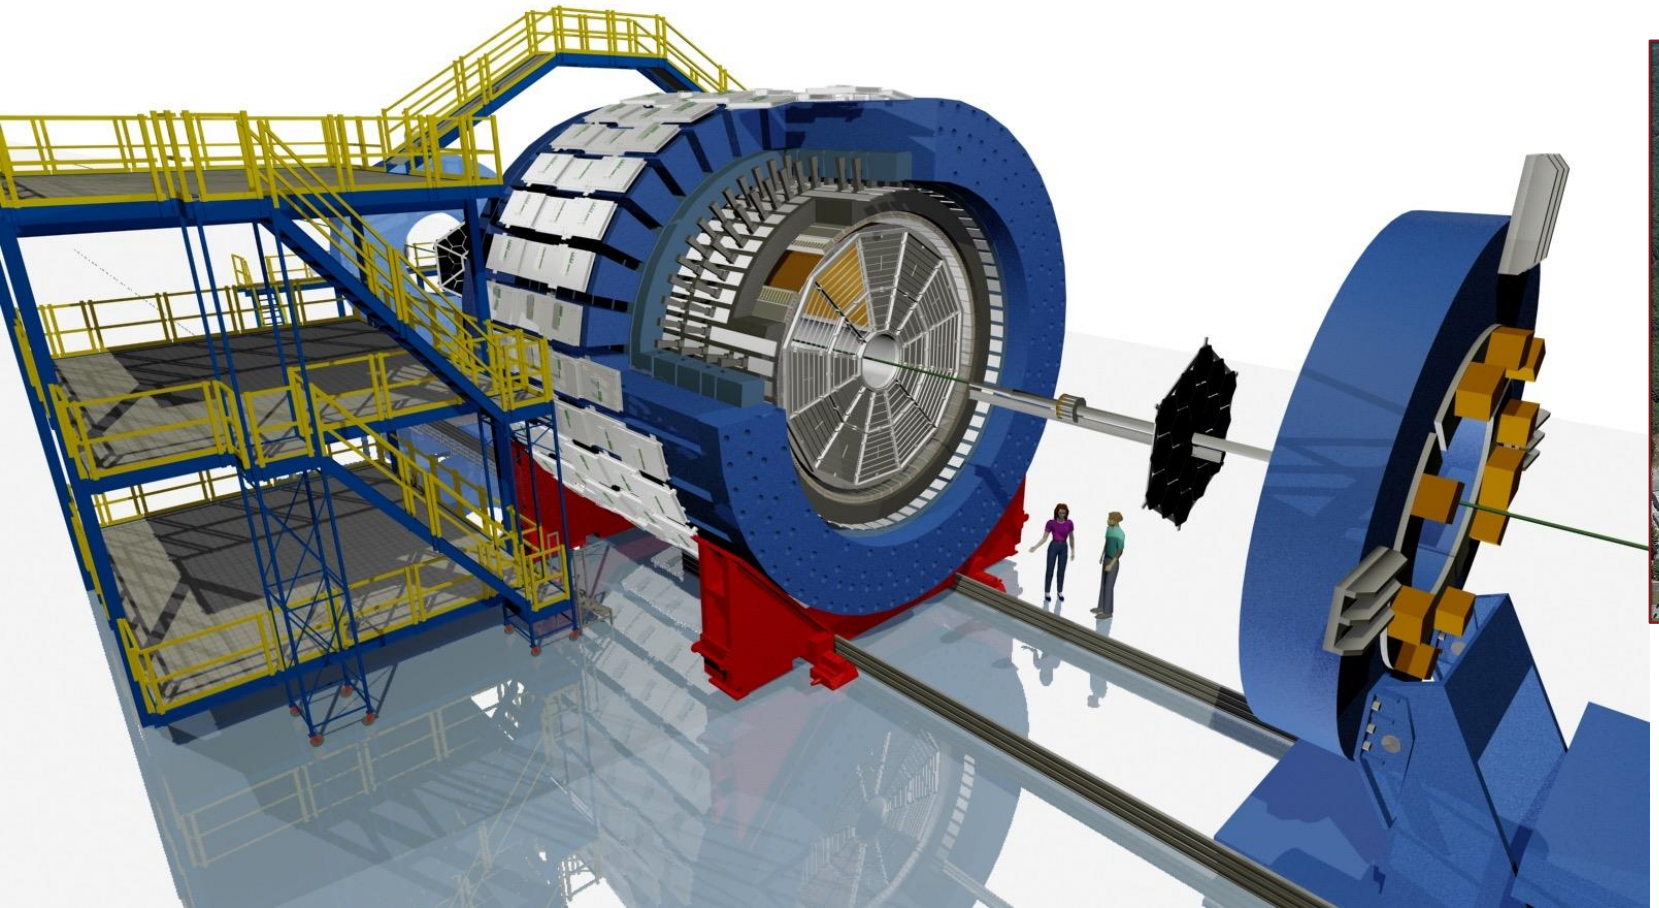


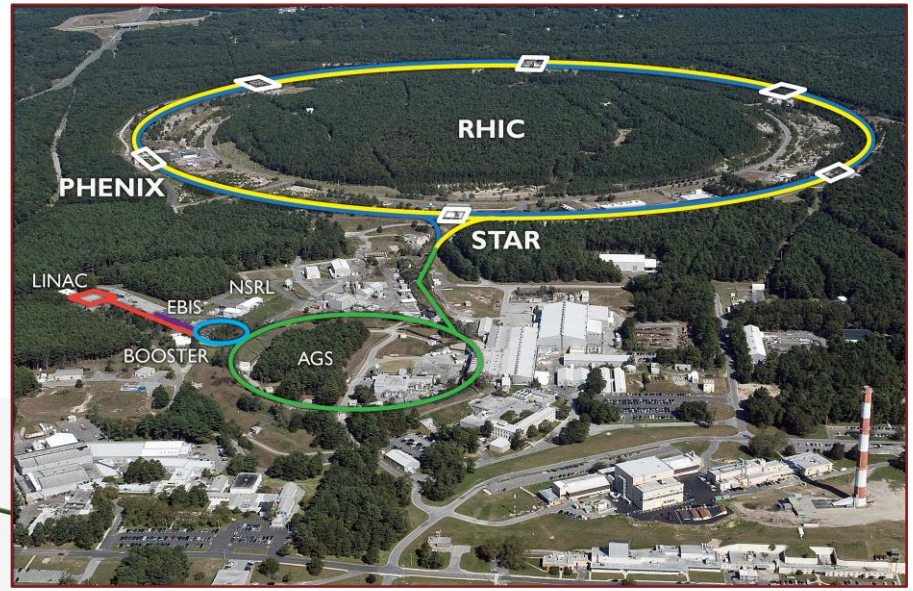
Open charm hadrons are studied via hadronic decays:

- $D^+(c\bar{d}) \rightarrow K^- \pi^+ \pi^+$, *branching ratio (BR) = (8.98 ± 0.28) %*
- $D^0(c\bar{u}) \rightarrow K^- \pi^+$, *BR = (3.93 ± 0.04) %*
- $D_s^+(c\bar{s}) \rightarrow \Phi \pi^+$, $\Phi \rightarrow K^- K^+$, *BR = (2.27 ± 0.08) %*
- $\Lambda_c^+(udc) \rightarrow K^- \pi^+ p$, *BR = (6.35 ± 0.33) %*

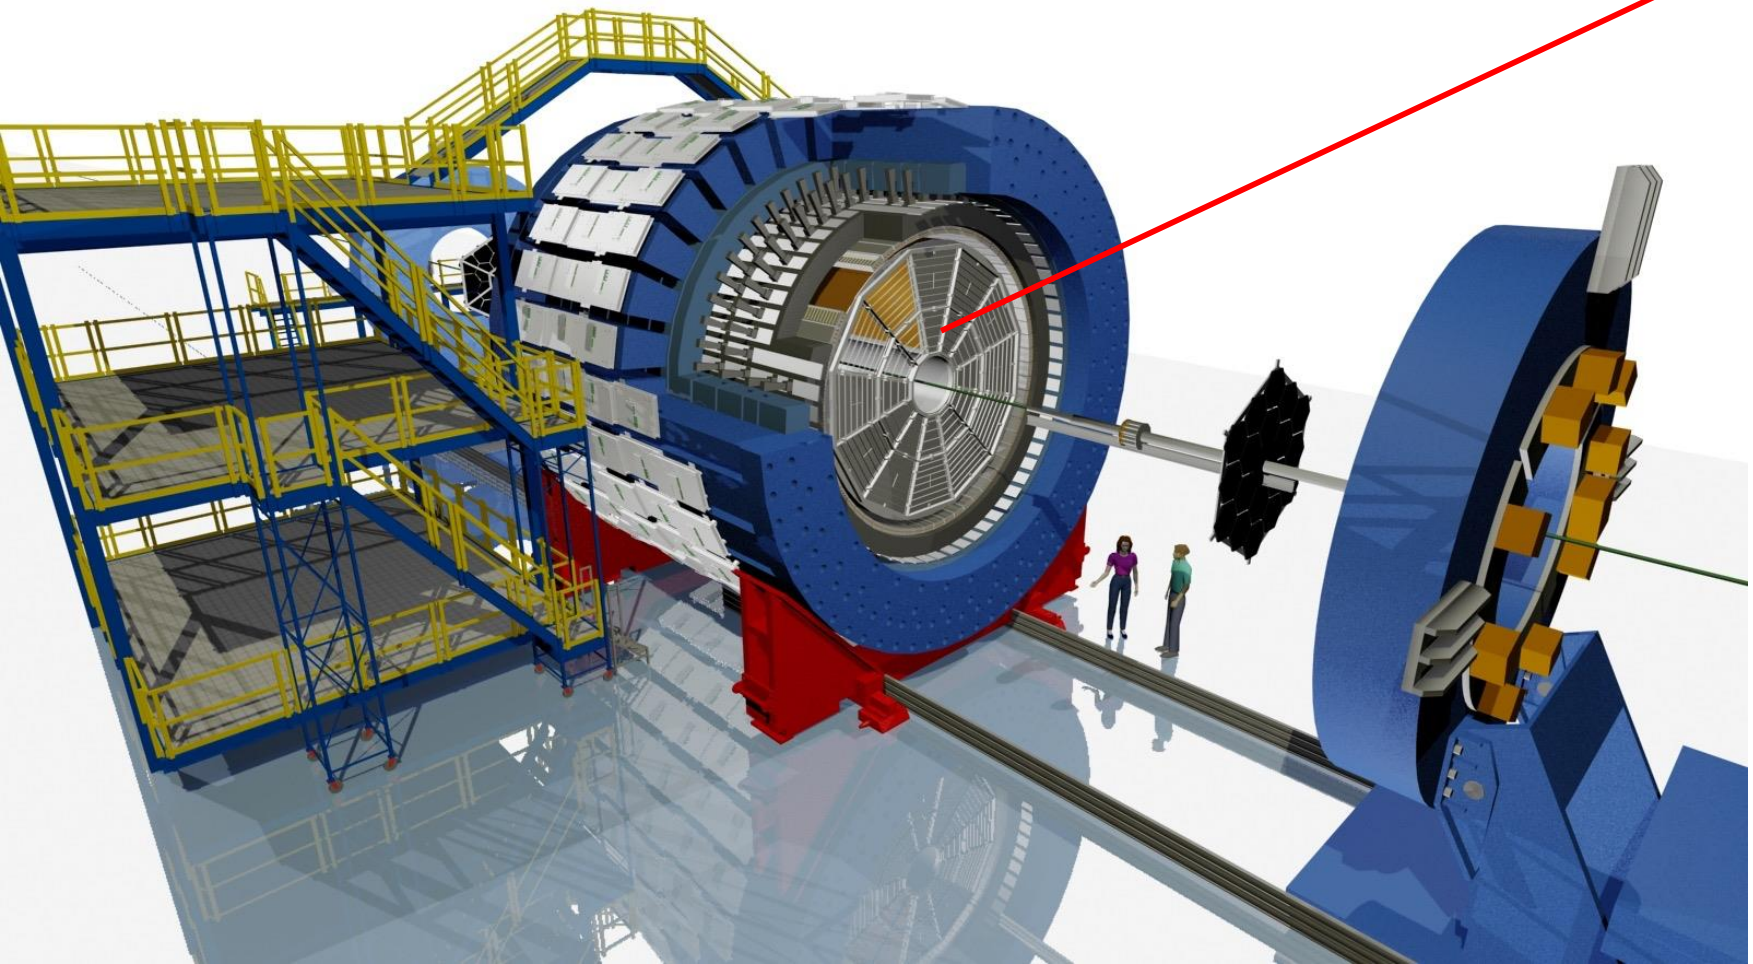
The Solenoid Tracker At RHIC

- Situated at **Relativistic Heavy-Ion Collider at Brookhaven National Laboratory (BNL) in the USA**
- Designed to study the strongly interacting matter
- Excels in **tracking and identification of charged particles** at mid-rapidity with full azimuthal coverage
- Most of the subsystems are immersed in 0.5 T solenoidal magnetic field



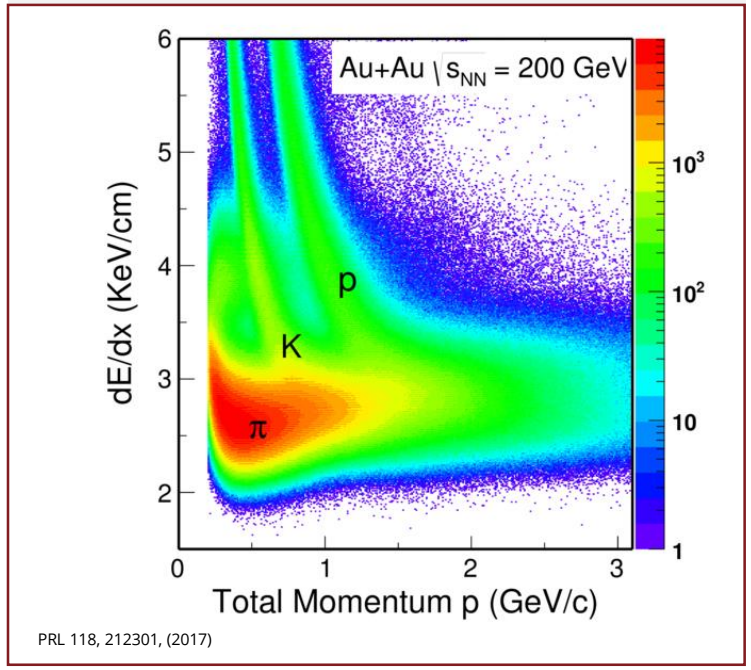


The Solenoid Tracker At RHIC



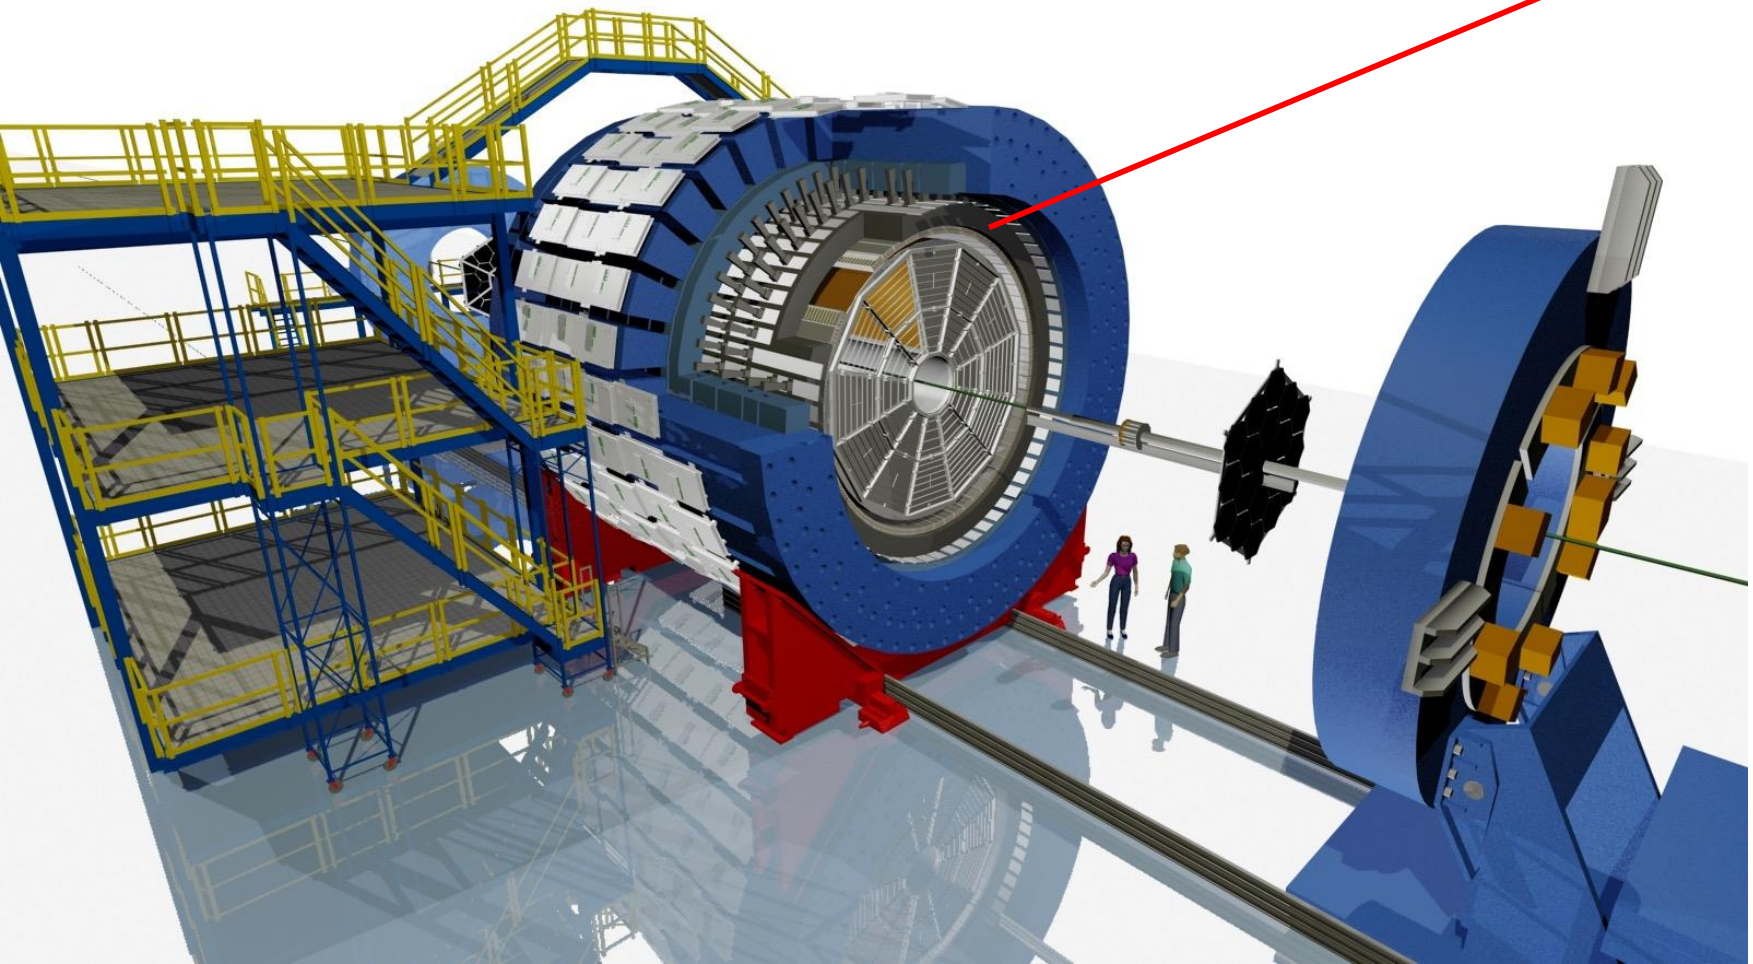
Time Projection Chamber (TPC)

- Main tracking device; momentum determination
- Particle identification via specific energy loss d*E*/d*x*



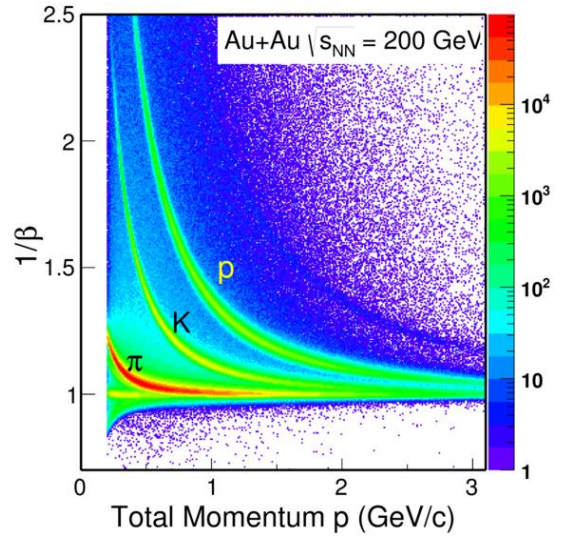
PRL 118, 212301, (2017)

The Solenoid Tracker At RHIC



Time Of Flight (TOF)

- Measures particle velocity β
- Improves particle identification in the momentum range of 0.6–3 GeV/*c*



PRL 118, 212301, (2017)

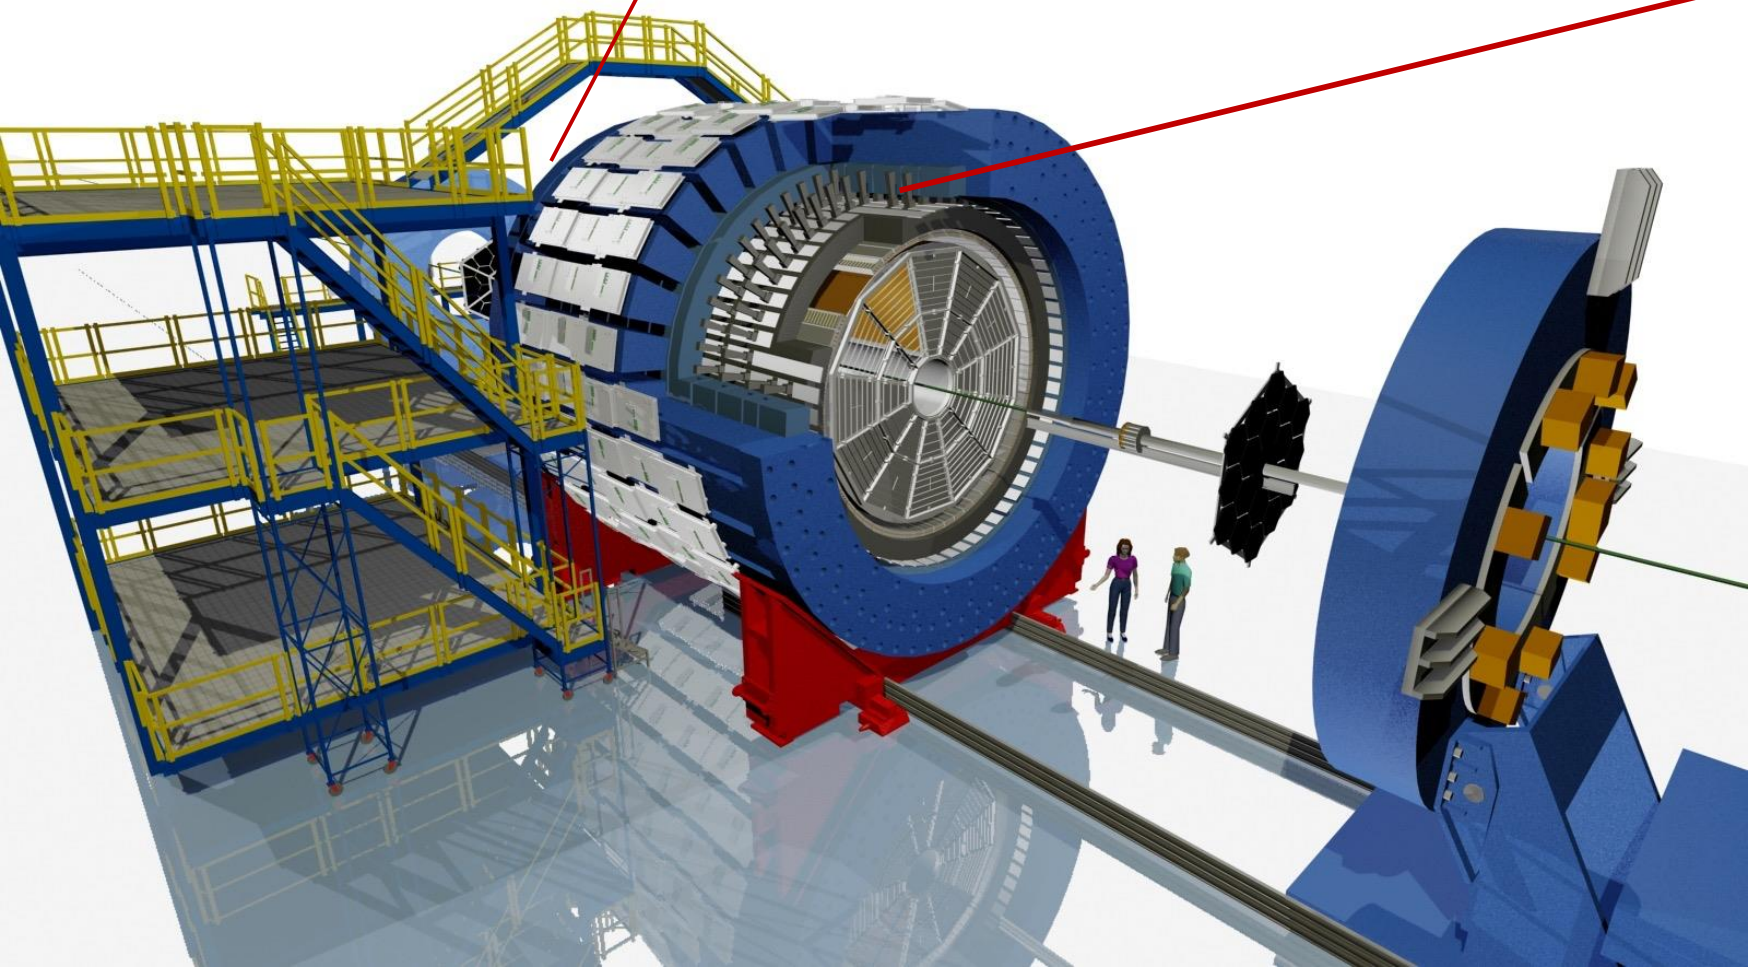
The Solenoid Tracker At RHIC

Forward Meson Spectrometer

- $2.5 < \eta < 4$
- Event plane measurements for flow studies

Barrel ElectroMagnetic Calorimeter

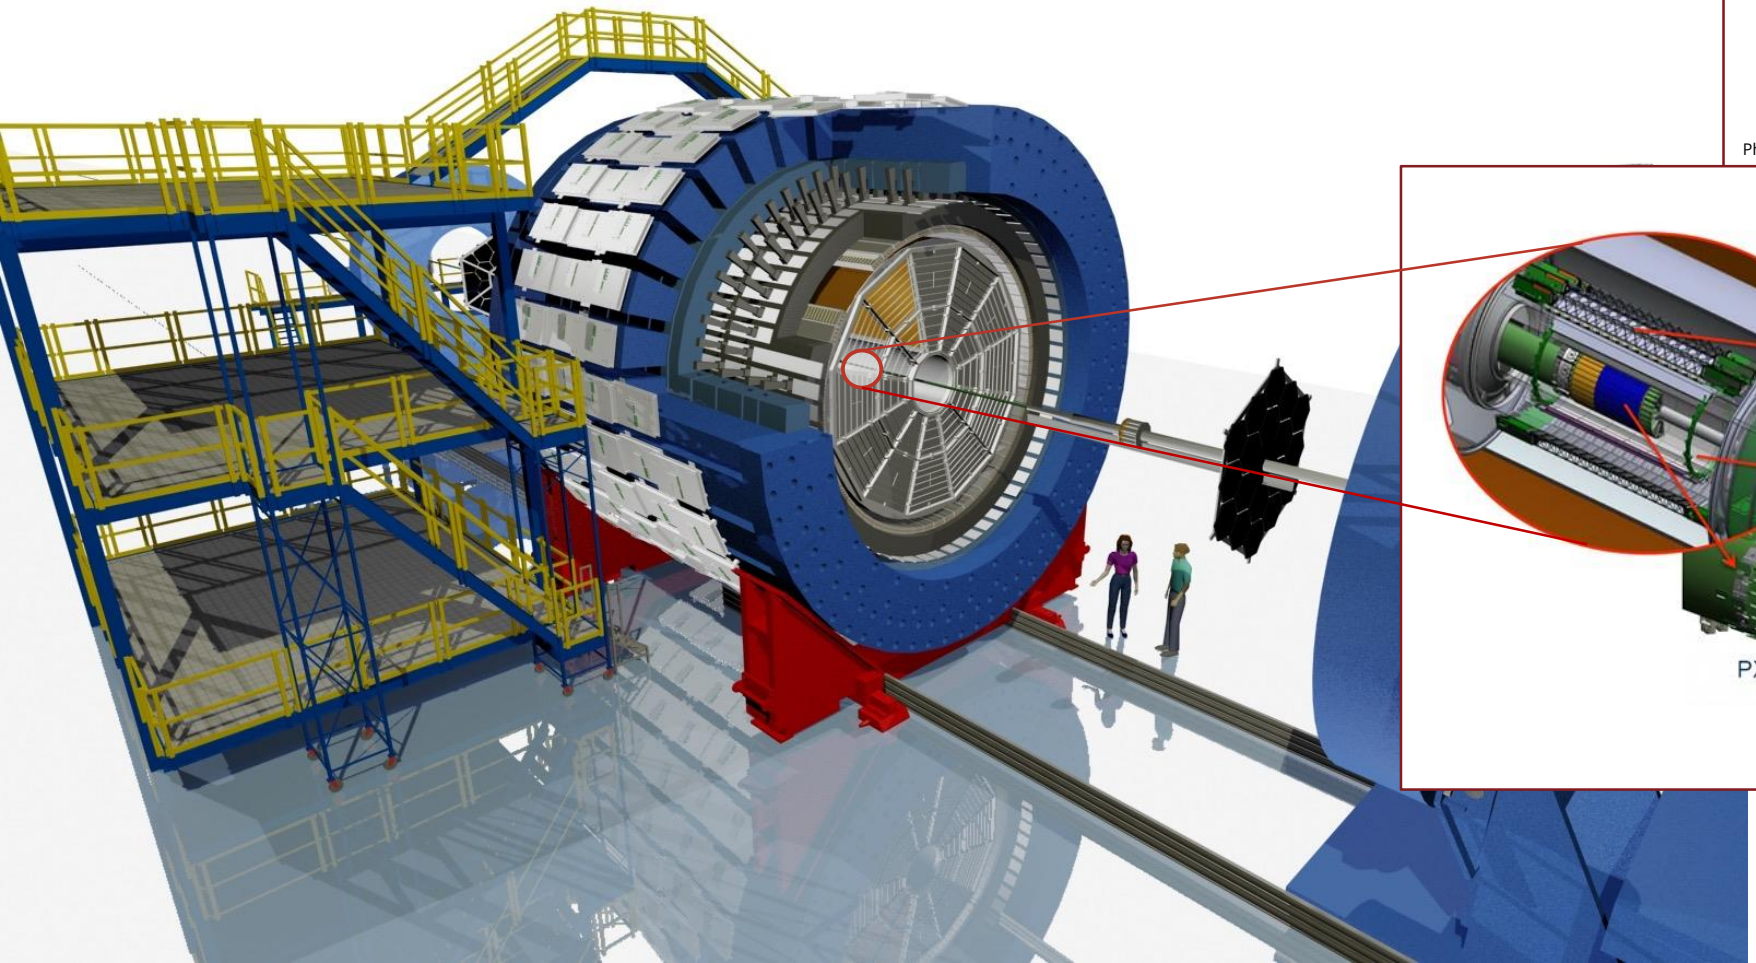
- Trigger on and identify high transverse momentum (p_T) electrons

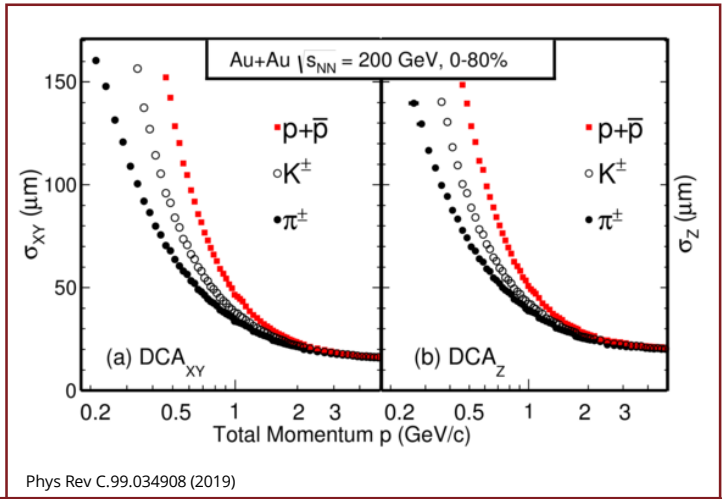


The Solenoid Tracker At RHIC

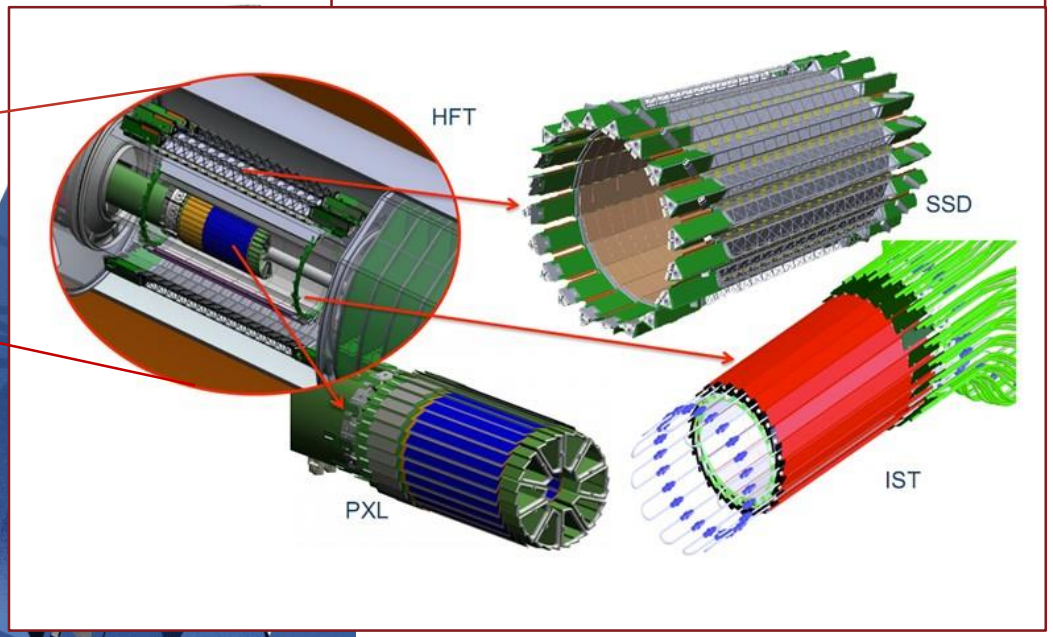
Heavy Flavor Tracker (HFT)

- Inner tracking system
- First application of MAPS in collider experiments
- Excellent **DCA_{xy} and DCA_z resolution: ~50 μm** for kaons at p_T = 750 MeV/*c*
- Significantly improves the signal/background for open HF reconstruction





Phys Rev C.99.034908 (2019)



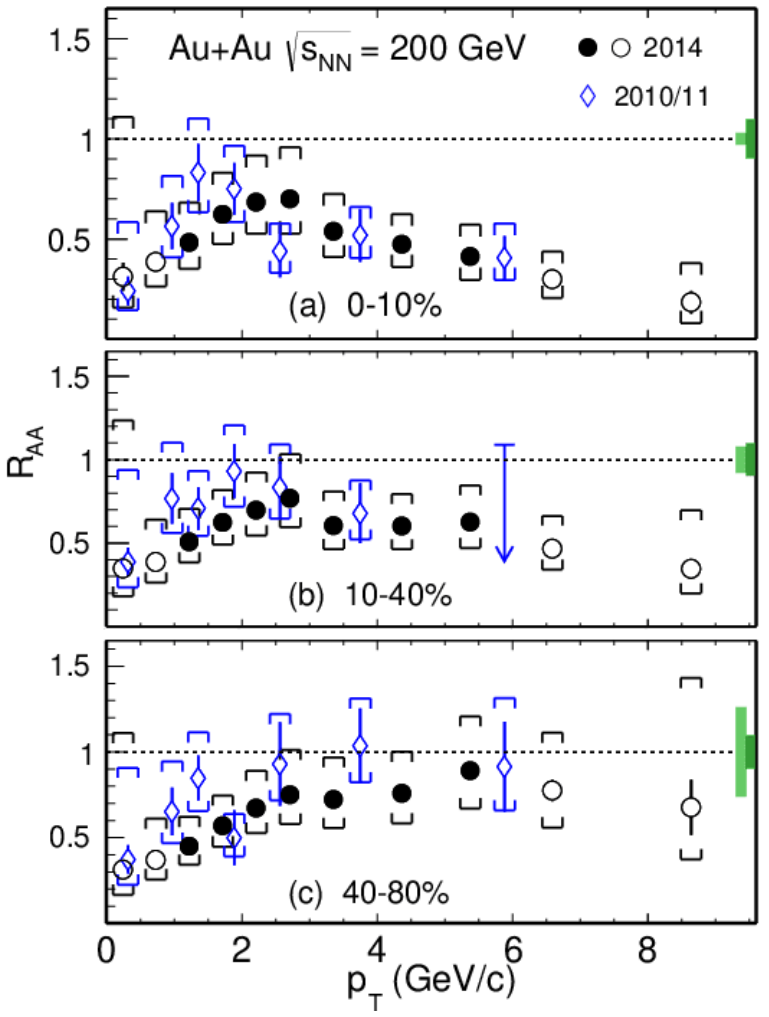
Energy loss in Au+Au collisions: D^0

- Nuclear modification factor R_{AA}:

$$R_{AA} = \frac{dN_{AA} / dp_T}{\langle T_{AA} \rangle d\sigma_{pp} / dp_T}$$

- Yields at high p_T are **greatly suppressed** in central collisions
- Suppression at high p_T decreases towards more peripheral collisions
- No significant centrality dependence for D^0 suppression at low p_T

STAR D^0: Phys Rev C.99.034908 (2019)



Energy loss in Au+Au collisions: D^0

- Nuclear modification factor R_{AA}:

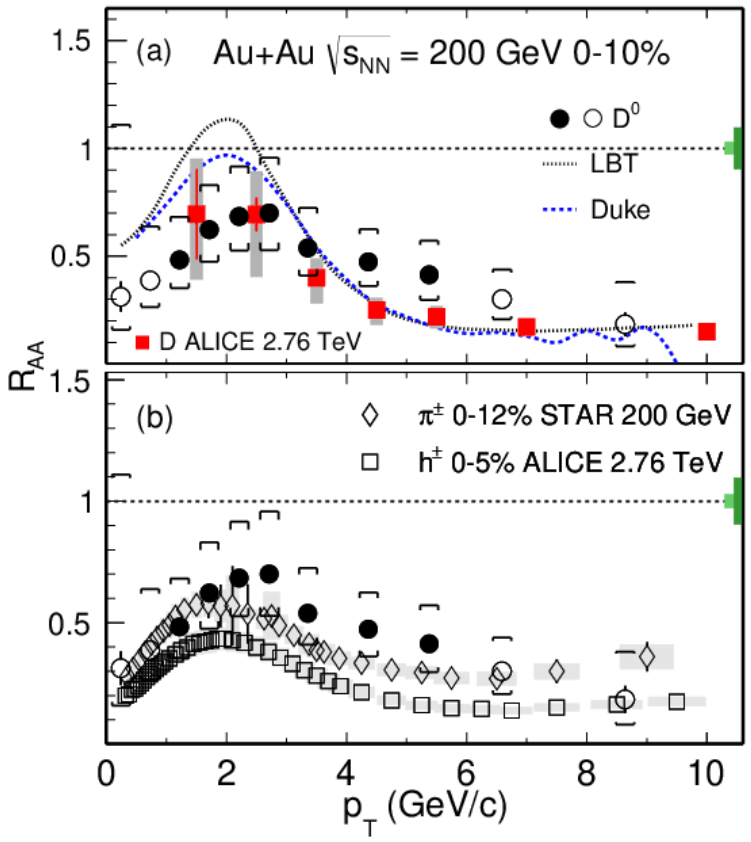
$$R_{AA} = \frac{dN_{AA} / dp_T}{\langle T_{AA} \rangle d\sigma_{pp} / dp_T}$$

- Yields at high p_T are **greatly suppressed** in central collisions
- Suppression at high p_T decreases towards more peripheral collisions
- No significant centrality dependence for D^0 suppression at low p_T

- D^0 shows **similar suppression to light mesons** at high p_T
- D^0 R_{AA} is **comparable to that from the LHC** measurements in Pb+Pb collisions at $\sqrt{s_{NN}}$ = 2.76 TeV
- Models that include both collisional and radiative losses are consistent with data at p_T > 3 GeV/c

- **Charm quarks lose significant amount of energy when traversing through the QGP**

STAR D^0: Phys Rev C.99.034908 (2019)



Energy loss in Au+Au collisions: D^0

- Nuclear modification factor R_{AA}:

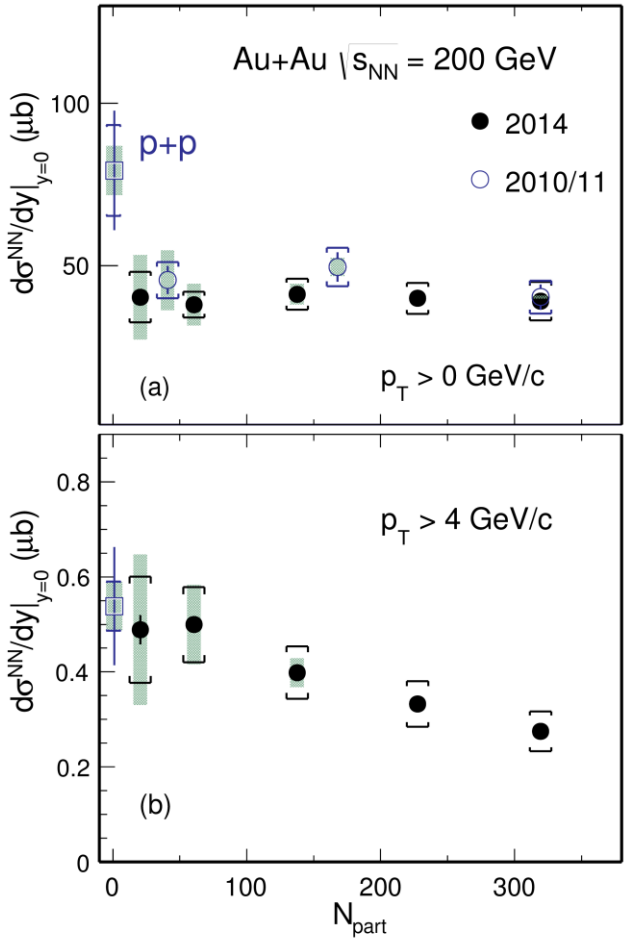
$$R_{AA} = \frac{dN_{AA} / dp_T}{\langle T_{AA} \rangle d\sigma_{pp} / dp_T}$$

- Yields at high p_T are **greatly suppressed** in central collisions
- Suppression at high p_T decreases towards more peripheral collisions
- No significant centrality dependence for D^0 suppression at low p_T

- D^0 shows **similar suppression to light mesons** at high p_T
- D^0 R_{AA} is **comparable to that from the LHC** measurements in Pb+Pb collisions at $\sqrt{s_{NN}}$ = 2.76 TeV
- Models that include both collisional and radiative losses are consistent with data at p_T > 3 GeV/c

- **Charm quarks lose significant amount of energy when traversing through the QGP**
- p_T-integrated D^0 cross-section is independent of centrality, and smaller than that in p+p collisions

STAR D^0: Phys Rev C.99.034908 (2019)



Energy loss in Au+Au collisions: $D^{\pm}$

- **Similar level of suppression and centrality dependence** for $D^{\pm}$ and D^0 mesons
- $D^{\pm}$/ D^0 yield ratios **are compatible with PYTHIA**

Poster by J. Vaněk – Thursday 13:39

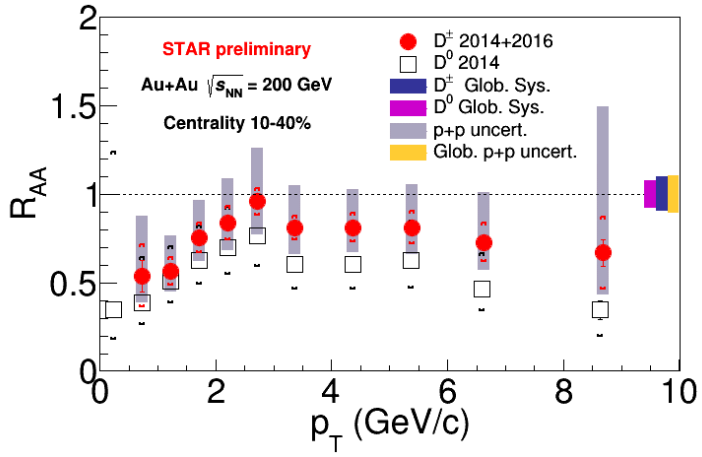
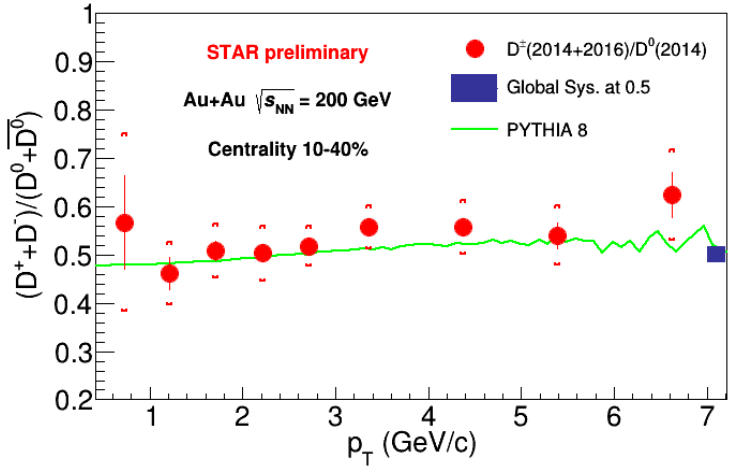
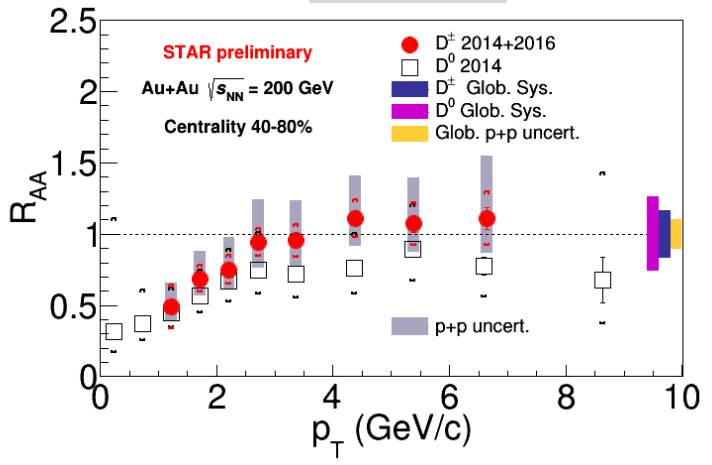
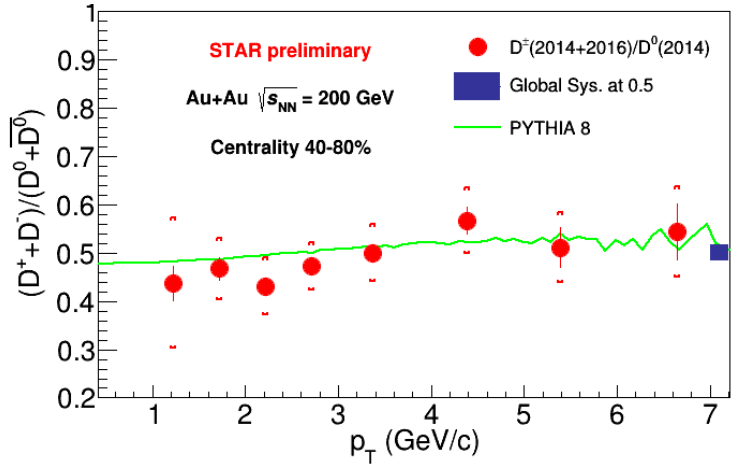
10–40%





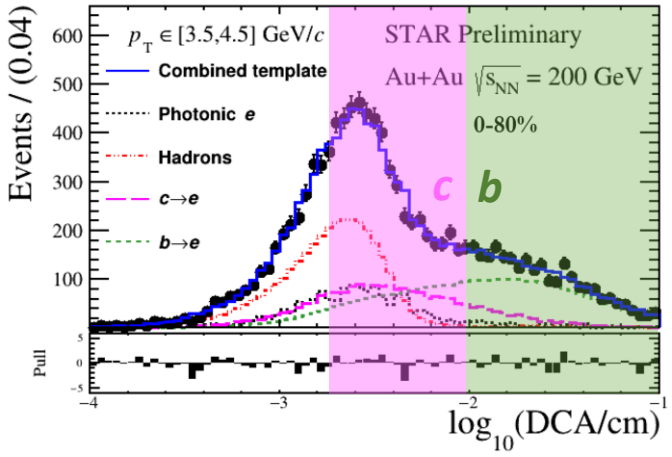
40–80%





STAR D^0: Phys Rev C.99.034908 (2019)

Energy loss in Au+Au collisions: heavy-flavor decayed electrons

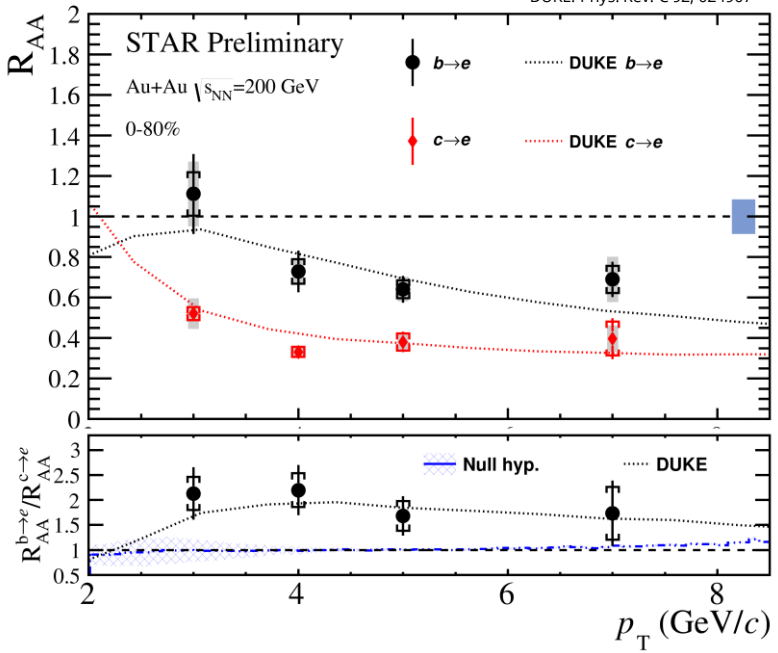


- Measurement of electrons from **charm and beauty** hadron decays
- Extract charm and bottom decayed **electron fractions**
  - background from photonic electrons and hadrons

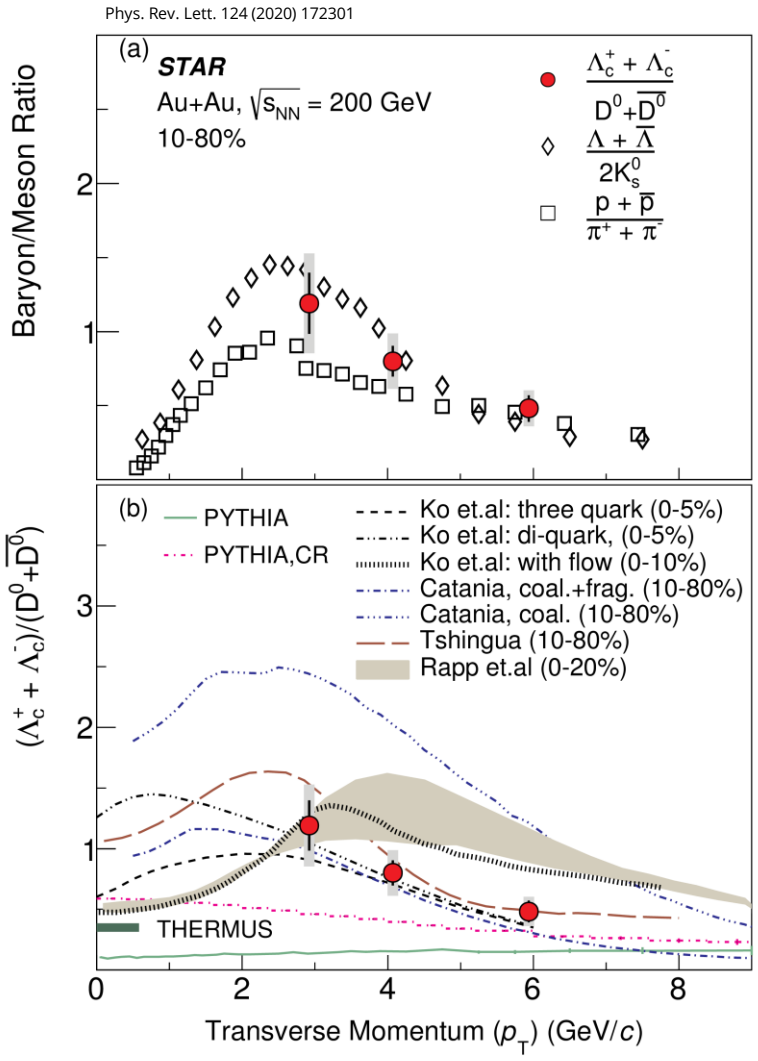
  → template fitting to Distance of Closest Approach (DCA) distribution (enabled thanks to HFT)

- Charm-decayed electrons show suppression at high-p_T of R_{AA} ~ 0.4
- Data consistent with DUKE model prediction
- Beauty-decayed electrons suppression is smaller than charm-decayed electrons with ≥ 3σ significance
  - **Evidence of mass dependence of energy loss**

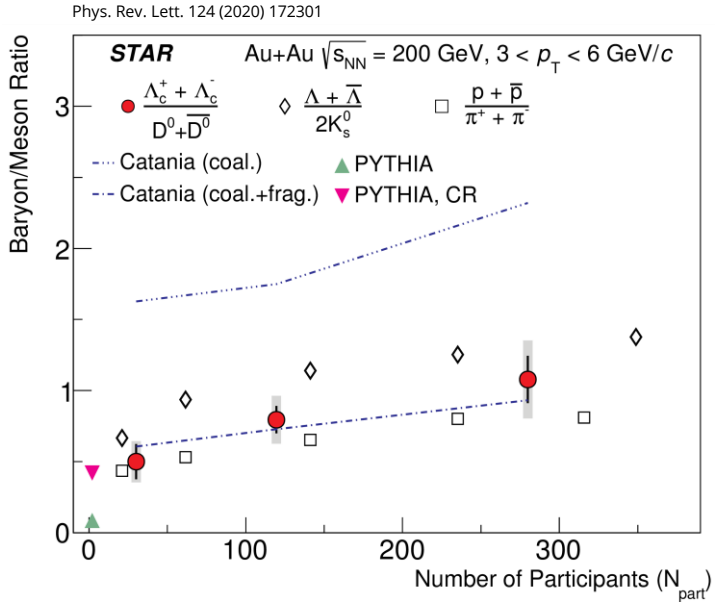
DUKE: Phys. Rev. C 92, 024907



Λ_c/D_0 yield ratio in Au+Au collisions



- Helps to understand charm quark hadronization
- Λ_c/D_0 is **comparable with baryon-to-meson** ratios for light and strange flavor hadrons
- Data can be used to **constrain model calculations**



- **Increase towards more central collisions:**
  - Similar to those for light and strange-flavor hadrons
  - Consistent with the Catania model calculation including both **coalescence and fragmentation hadronization**

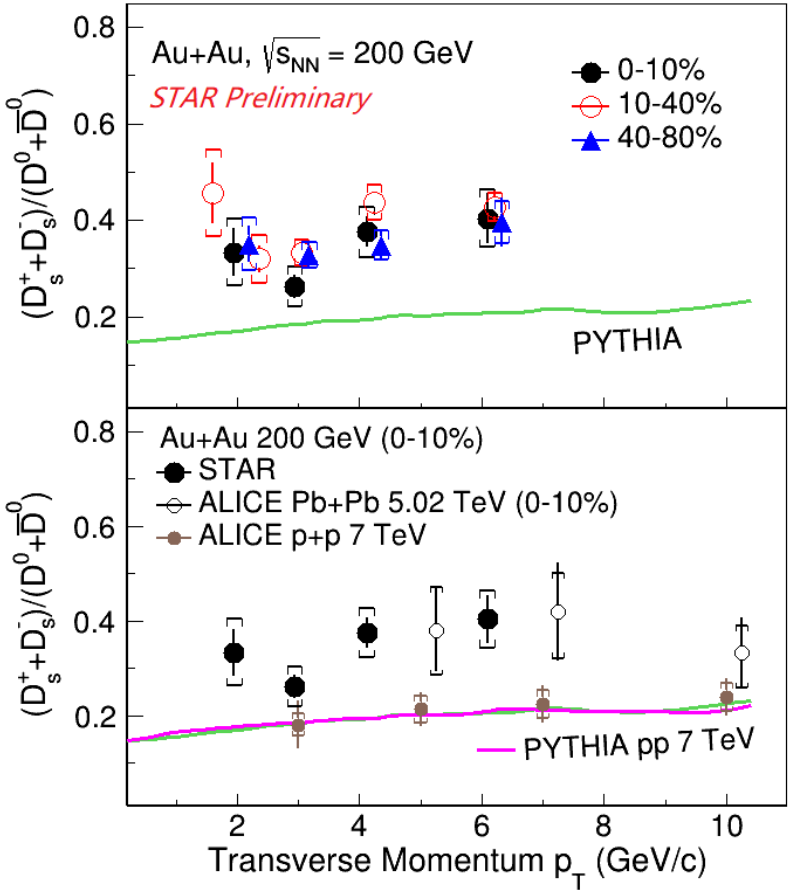
D_s/D_0 yield ratio in Au+Au collisions

- D_s/D_0 yield ratio probes **strangeness enhancement** and **coalescence of charm** quarks with strange quarks in QGP

- Significantly larger than fragmentation baseline (PYTHIA p+p)
- No significant centrality dependence

- PYTHIA calculation consistent with ALICE p+p results at $\sqrt{s}$ = 7 TeV
- STAR measurements at high p_T are consistent with ALICE Pb+Pb results at $\sqrt{s_{NN}}$ = 5.02 TeV

ALICE p+p: ALICE Collaboration, Eur. Phys. J. C (2017) 77: 550.
ALICE Pb+Pb: ALICE Collaboration, J. High Energ. Phys. (2018) 2018: 174.



D_s/D_0 yield ratio in Au+Au collisions

- D_s/D_0 yield ratio probes **strangeness enhancement** and **coalescence of charm** quarks with strange quarks in QGP

- Significantly larger than fragmentation baseline (PYTHIA p+p)
- No significant centrality dependence

- Catania model calculation with only coalescence hadronization describes data for $p_T > 4$ GeV/c
- Catania model calculation with both coalescence and fragmentation hadronization describes data for lower p_T
- **Tsinghua model with sequential coalescence hadronization** qualitatively describes data

- Enhancement of D_s meson in Au+Au collisions suggests that **charm quarks also participate in coalescence hadronization** in the QGP

Total charm cross section

Coll. system	Hadron	dσ/dy [μb]
Au+Au at 200 GeV (10-40% central)	D^0	41 ± 1 ± 5
	D^+	18 ± 1 ± 3
	D_s	15 ± 1 ± 5
	Λ_c	78 ± 13 ± 28
	Total	**152 ± 13 ± 29**
p+p at 200 GeV	**Total**	**130 ± 30 ± 26**

STAR p+p: Phys Rev Lett.121.229901

D^0:

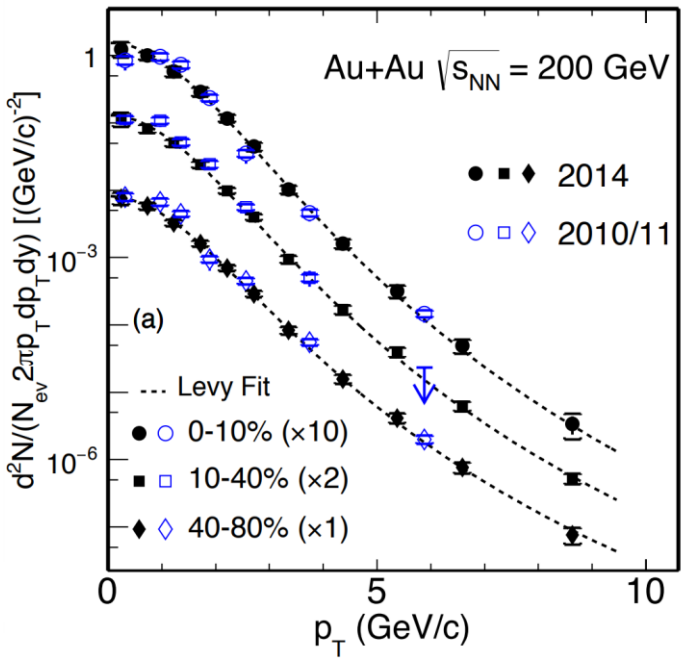
- measured down to zero p_T

D^+ and D_s:

- Levy (power law) fits to measured spectra and extrapolate down to zero p_T

Λ_c:

- using Λ_c/D^0 in 10-80% central collisions
- three model calculations fit to data and extrapolate down to zero p_T, differences are included in systematics



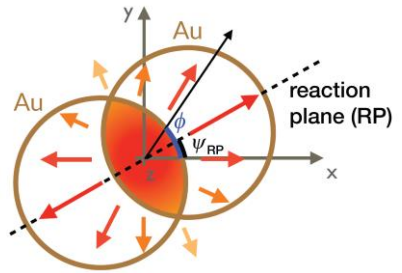
- The charm quark cross-section in **Au+Au collisions**, scaled by the number of binary nucleon-nucleon collisions, is **consistent with that measured in p+p collisions** within the uncertainties
- **Redistribution of charm quarks** among open-charm hadron species

Elliptic flow v_2 of D^0

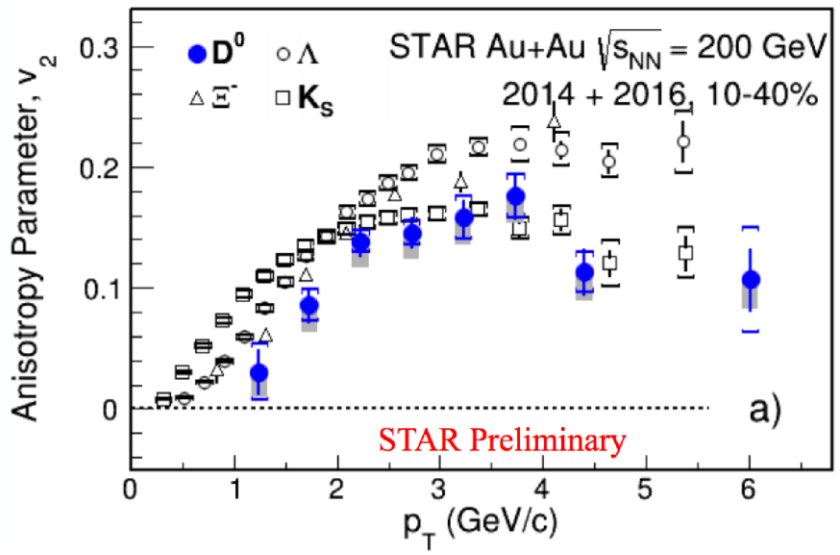
- Fourier expansion of the **particle yield** with respect to the event plane:

$$E\frac{d^3N}{d^3p} = \frac{1}{2\pi}\frac{d^2N}{p_T dp_T dy}\left(1+\sum_{n=1}^{\infty} 2v_n \cos\left[n\left(\phi-\psi_{RP}\right)\right]\right)$$

- Light flavor v_2 suggests **hydrodynamic behavior** of a strongly interacting matter

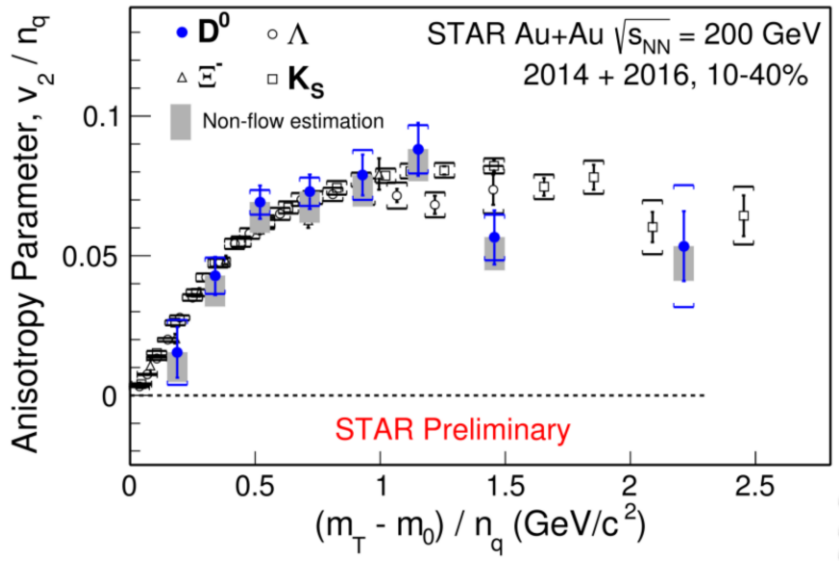


STAR D^0 v_2 2014: Phys. Rev. Lett. 118 (2017) 212301



- $p_T < 2$ GeV/c: clear mass ordering of v_2
- $p_T > 2$ GeV/c: D^0 v_2 consistent with light mesons

STAR D^0 v_2 2014: Phys. Rev. Lett. 118 (2017) 212301

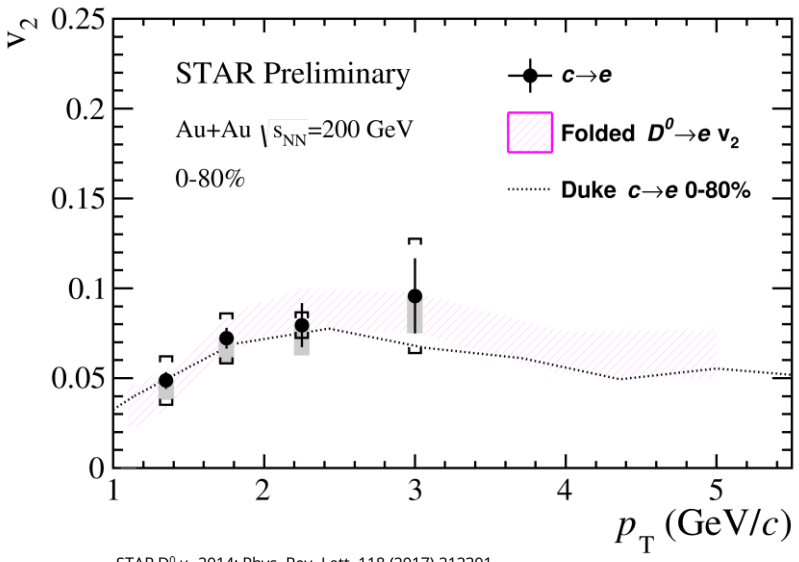


- D^0 v_2 follows number of constituent quarks scaling
  → suggesting that **charm quarks flow with the QGP**

Elliptic flow v_2 of heavy-flavor decayed electrons

Charm-decayed electrons

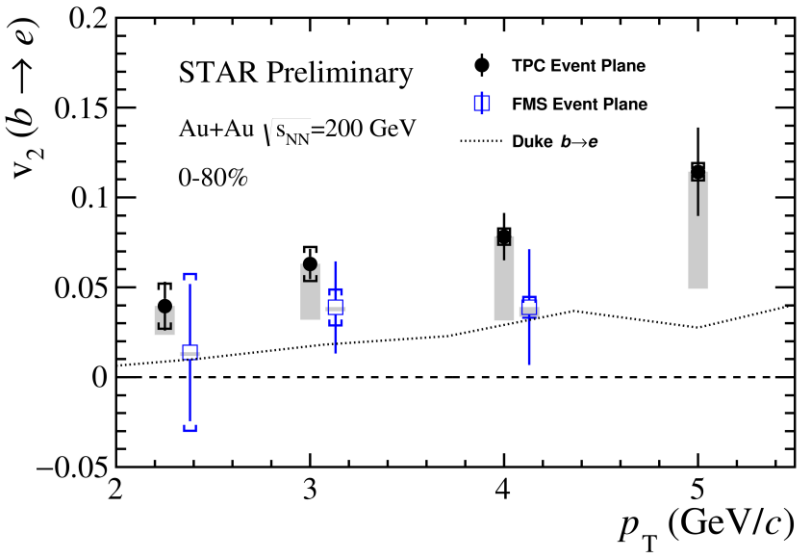
- Measured D^0 v_2 folded to decayed electron v_2 with semi-leptonic decays simulated in EvtGen
- **Charm electron v_2 consistent with folded D^0 v_2** and DUKE model



STAR D^0 v_2 2014: Phys. Rev. Lett. 118 (2017) 212301
DUKE: Phys. Rev. C 92, 024907

Beauty-decayed electrons

- First observation of **non-zero bottom electron v_2**
  - TPC event plane measurement with full non-flow subtraction **significant at 3.4σ**
- Forward Meson Spectrometer ($2.5 < \eta < 4$) as event plane detector reduces non-flow to 0.5%

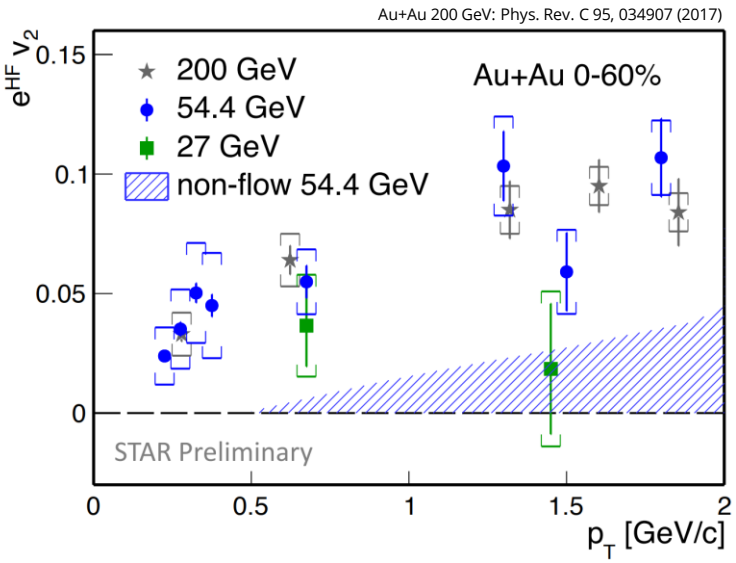


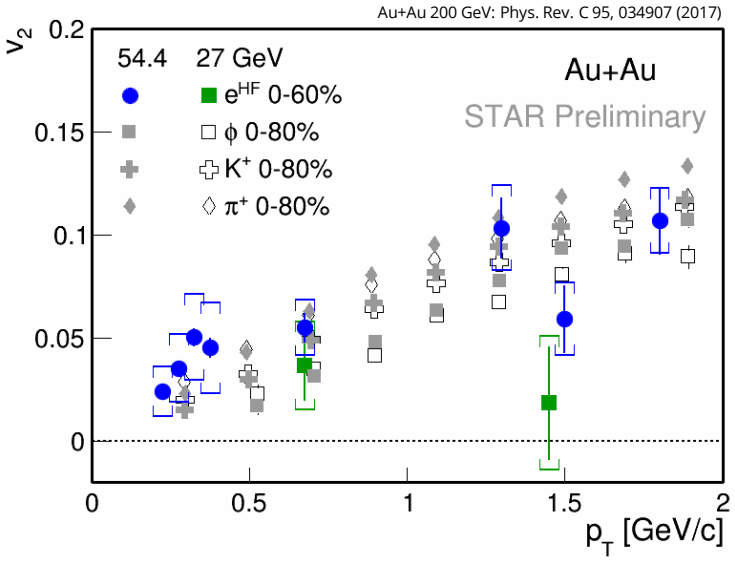
Elliptic flow v_2 of heavy-flavor decayed electron

Comparison of HF decayed electron v_2 in Au+Au collisions at $\sqrt{s_{NN}}$ = 27, 54.4 and 200 GeV

- Results in **54.4** GeV Au+Au collisions show v_2 comparable to that in **200** GeV
- Hint for lower v_2 in Au+Au collisions at **27** GeV than those at **54.4** and **200** GeV

- Comparable to light flavor meson v_2 at **54.4 GeV**

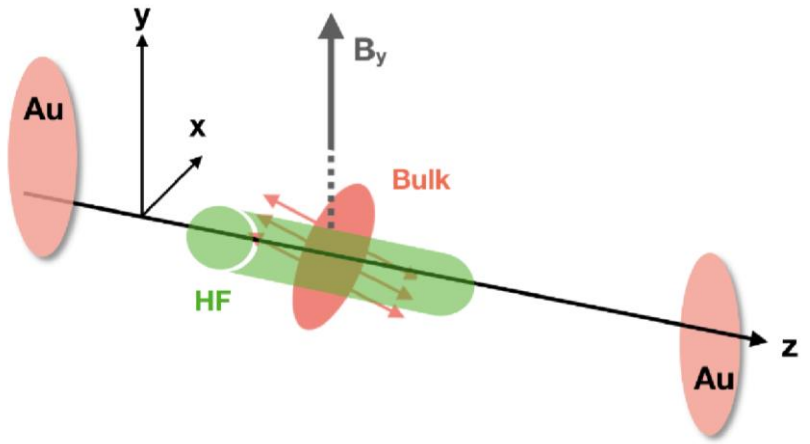




- **HF quarks interact strongly with the medium in 54.4 GeV Au+Au collisions**

Charm quark directed flow v_1

- Important to study **initial conditions** of heavy-ion collisions
- **Hydro models:**
  - v_1 magnitude depends on viscous drag on charm quarks and initial **tilt of QGP bulk**
- **Initial electromagnetic field:**
  - **opposite effects for c and $\bar{c}$**
  - induce larger v_1 for charm quarks than for light flavor quarks, due to the early production of charm quarks



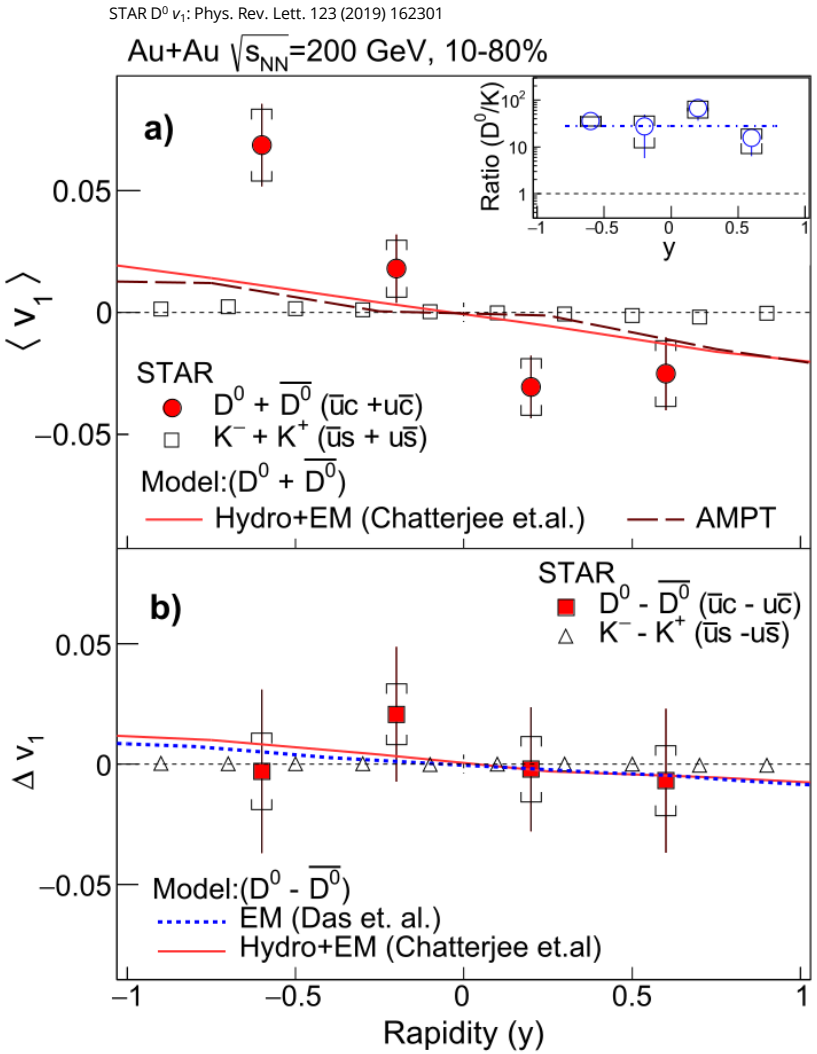
Charm quark directed flow v_1

- Important to study **initial conditions** of heavy-ion collisions
- **Hydro models:**
  - v_1 magnitude depends on viscous drag on charm quarks and initial **tilt of QGP bulk**
- **Initial electromagnetic field:**
  - **opposite effects for c and $\bar{c}$**
  - induce larger v_1 for charm quarks than for light flavor quarks, due to the early production of charm quarks

---

- Measured D^0 v_1 slope is ~5-20 times larger than that for kaons
- Tilted source models **predict the correct sign** of dv_1/dy, but the v_1 magnitudes are lower than data

  → **Help to constrain initial conditions**



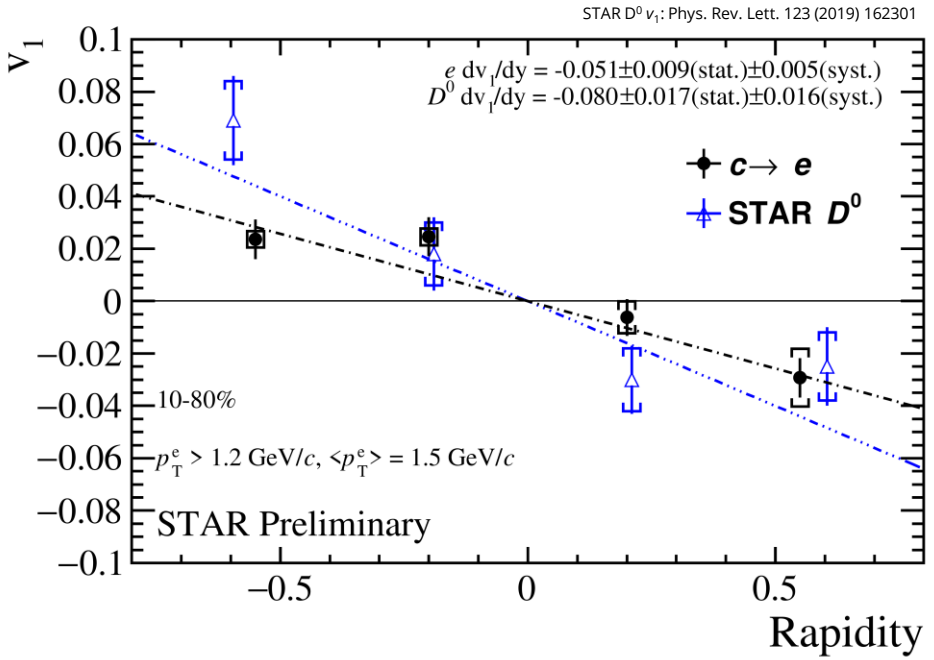
Charm quark directed flow v_1

- Important to study **initial conditions** of heavy-ion collisions
- **Hydro models:**
  - v_1 magnitude depends on viscous drag on charm quarks and initial **tilt of QGP bulk**
- **Initial electromagnetic field:**
  - **opposite effects for c and $\bar{c}$**
  - induce larger v_1 for charm quarks than for light flavor quarks, due to the early production of charm quarks

---

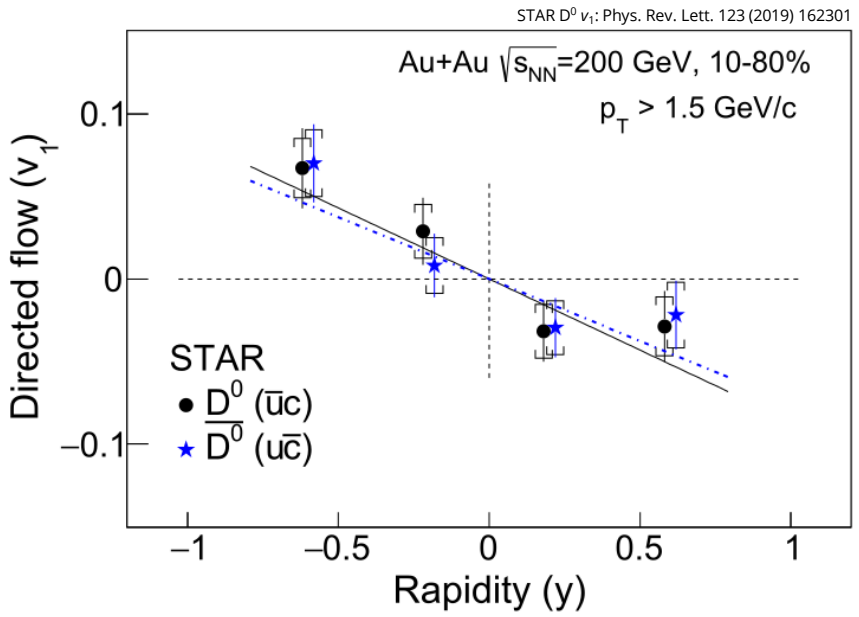
- Measured D^0 v_1 slope is ~5-20 times larger than that for kaons
- Tilted source models **predict the correct sign** of dv_1/dy, but the v_1 magnitudes are lower than data
  → **Help to constrain initial conditions**

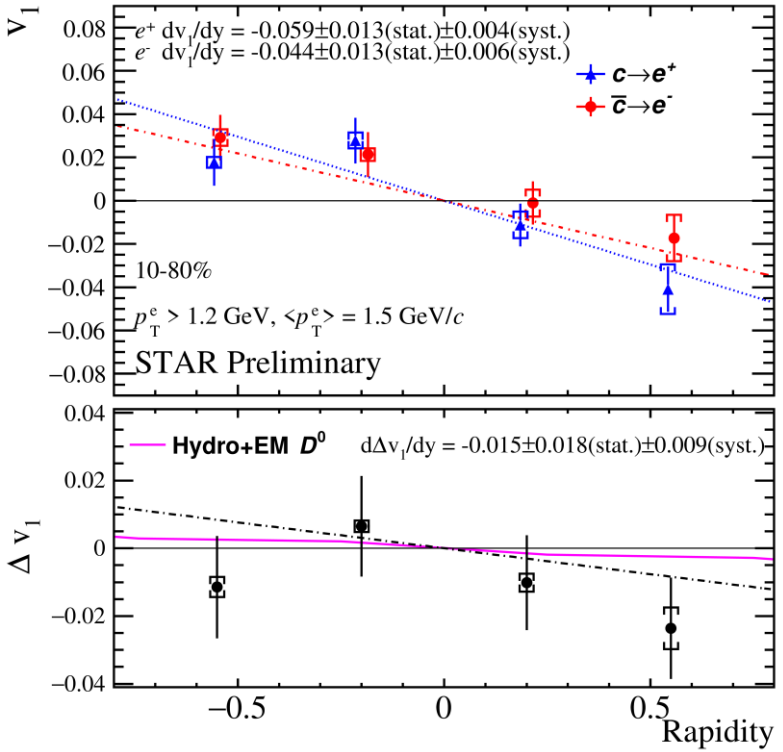
- v_1 magnitude of **charm-decayed electrons is consistent with D^0 mesons**



Charm quark directed flow v_1

- c and $\bar{c}$ v_1 magnitude probed by both charmed-decayed electrons and D^0 mesons
  - Within the uncertainties, **no splitting due to electromagnetic field**





Conclusions

- D meson production is **strongly suppressed** in central Au+Au collisions compared to that in p+p collisions
  - → strong charm-medium interactions
  - → less suppression of beauty-decayed electrons compared to charm-decayed ones
- D^0 meson and charm-decayed electrons exhibit similar v_2 as light flavor in Au+Au collisions
  - → charm quarks **have gained significant flow** in the QGP
  - → charm quarks may have **achieved local thermal equilibrium**
- Directed **flow v_1 of D^0 is significantly larger** than that for light hadrons
  - → constraints for the geometric and transport parameters of the hot QCD medium
  - → observed no c and $\bar{c}$ splitting due to electromagnetic field within uncertainties
- Charm quarks participate in **coalescence hadronization** in the QGP
  - → Total per-NN charm quark cross section consistent with p+p, but **charm hadrochemistry significantly modified**
