J-PARC Neutrino Beam Upgrades towards 1.3 MW Beam Power for Long-Baseline Neutrino Oscillation Experiments in Japan

Tetsuro Sekiguchi (KEK/J-PARC)

for J-PARC Neutrino Beamline Group

July 30, 2020

40th International Conference on High Energy Physics (ICHEP 2020)

Outline

- Overview of accelerator neutrino beam
- J-PARC neutrino beamline
 - Current status
 - Future upgrades
- International cooperation on high power neutrino beam
- Summary

Overview

J-PARC neutrino beam to Kamioka (T2K / Hyper-K)

- Accelerator-based neutrino oscillation experiments are playing an important role in neutrino physics since 1999
 - Recent T2K results showed a hint of large CP violation in neutrino sector
- Next generation experiments (Hyper-K/DUNE) are aiming to reveal full picture of neutrino oscillation with precise measurements of CP and mixing parameters, and determination of mass ordering
 - Sensitivity for CP violation $2 \sim 3\sigma$ (current) $\rightarrow > 5\sigma$ (future)
 - > 10 times statistics needed
- To achieve it,
 - ~10 x larger new detectors
 - >1MW-class beam power needed

Progress on High Power Neutrino Beam

Neutrino beam facilities for long baseline experiments

Note: Beam power (kW) = Beam energy (GeV) x Current (µA)

4

How To Produce Neutrino Beam?

- High intensity proton beam hit a graphite target
- Secondary π/K 's focused by magnetic horns and decay to neutrinos
 - Neutrino beam from $\pi^+ \rightarrow \mu^+ + v_{\mu}$
 - Antineutrino beam from $\pi^{-} \rightarrow \mu^{-} + \overline{\nu}_{\mu}$
 - Sign-selected neutrino beam by flipping the horn polarity
- All hadrons absorbed by beam dump
- High energy muons penetrating beam dump measured by muon monitors

J-PARC

Neutrino Beamline

Status of J-PARC Neutrino Beam

- Started physics data taking in January 2010
- 515 kW stable operation achieved : 2.66x10¹⁴ protons/pulse
 - ⇒ World-highest intensity in fast-extracted beam from proton synchrotron
 - Beam power limited by space charge effect, beam instability due to insufficient RF voltage
- Provide 3.64x10²¹ protons on target (POT) to T2K
 - v mode POT : 1.99x10²¹ (54.7%), anti-v mode POT : 1.65x10²¹ (45.3%)

J-PARC Upgrade Toward 1.3 MW

J-PARC Neutrino Beamline Upgrade

• Baseline design

- Beamline components designed to accept 3.3x10¹⁴ ppp
- Replaceable components designed for 750 kW (can be upgraded later)
- Non-replaceable components (HV, DV, BD) designed for 3-4 MW

• Necessary upgrade toward 1.3 MW

- Improve cooling capacity to remove larger heat generated by higher power beam
 - Target He cooling, water cooling for horn, He vessel etc
- Accommodate shorter cycle operation
 - Horn operation, DAQ
- Accommodate larger amount of radioactivity produced by higher power beam
 - Upgrade radioactive waste disposal facility
- Safe and reliable control of higher power beam
 - Improved control system and beam monitors

Target Upgrade

Original target design

- To survive thermal shock by 3.3×10^{14} ppp beam $\Rightarrow 3.2 \times 10^{14}$ ppp should be OK
- Cooling capacity only 900 kW
- Improvement
 - Higher He flow rate needed to improve cooling performance
 - 0.5 MPa pressure needed \Rightarrow high pressure tolerance
 - He compressor upgrade
 - Thermal analysis for 1.3 MW ⇒ max temp. ~900°C expected
 - Further optimization to be done
 - Vacuum insulation pipes developed for higher temp. (~200°C) He flow \Rightarrow to
 - Prototyping of new target with high pressure tolerance ongoing \Rightarrow to be installed in FY2025
 - He circulation system upgrade scheduled in FY2025

	0.75 MW	1.3 MW			
Helium pressure	1.6 bar	5 bar			
Pressure drop	0.83 bar	0.88 bar			
Helium mass flow	32 g/s	60 g/s			
Heat load	23.5 kW	40.8 kW			
US window temp	105 °C	157 °C			
DS window temp	120°C	130°C			
Targe core temp	736 °C 9	09 °C			

Horn Upgrade

- Horn electrical system upgrade for 320 kA at 1 Hz
 - Horn current 250 kA \rightarrow 320 kA (design)
 - ~10% flux gain for right-sign neutrinos
 - 5~10% flux reduction for wrong-sign neutrinos
 - Three power supplies to drive three horns (one-by-one)
 - New electrical system (PS, transformer, striplines) developed
 - Staged upgrade
 - 1 Hz (@250kA) operation after FY2022
 - 320 kA operation by adding 3rd PS (FY2023~)
- Conductor cooling improvement (for Horn2)
 - Stripline cooling
 - Forced He flow scheme not enough for 1.3 MW
 - Water-cooled striplines established
 - Upstream conductor cooling implemented

Stainless pipe embedded aluminum plate

Current config.

Proposed config.

Expected temperature at striplines

Other Upgrade Items

- Radio-active water disposal facility upgrade (FY2020~2021)
 - Produced tritiated water must be diluted and disposed
 - Current limitation comes from size of dilution tank 84 m³
 - Additional 400 m³ tank under construction
- Cooling capacity improvement for secondary beamline (FY2025)
 - Current capacity is ~1MW
 - Pumps, heat exchangers, and chillers will be replaced
- New beam profile monitor development for high intensity beam
 - Beam-induced fluorescent profile monitor
- Control/DAQ upgrade for 1 Hz operation (~FY2022)

Tentative Timeline

Acceptable beam power	EV2020	EV2021	EV20	22	EV2022	EV2024	EV2025	EV2026
1.3 MW	F12020	F 1 202 1	F I ZU		F 12025	FT2U24		112020
900 kW 750 kW								
500 kW

International Cooperation on High Power Neutrino Beam

- Good relationship among KEK, Fermilab, CERN experts since 1999 (including participation from many other institutes)
 - Detailed discussions and information exchange in Neutrino Beam and Instrumentation (NBI) workshop series
 - Many lessons learned from other facilities
- **US-Japan Cooperative Programs in High Energy Physics**
 - Accelerator and beamline R&D for high power neutrino beam since 2014
 - KEK-Fermilab collaboration in accelerator and neutrino beamline development
 - LBNF-specific program launched since 2018
 - KEK-Fermilab collaboration for LBNF
- CERN-KEK cooperation for accelerator and beamline technology
 - Accelerator technology (RF, beam monitors, etc)
 - Expanding to other fields (radiation damage, beamlines)

KEK contribution to LHC upgrade on RF

CERN Courier Jul/Aug 2017

LHC luminosity upgrade accelerates

ERN has recently implemented two mortant steps towards the High uminoity LHC (HL-LHC) - an upgrade hat will increase the intensity of the LHC's ollisions significantly from the early 2020s. reparing CERN's existing accelerator omplex to cope with more intense proton earns prosents several challenges, in articular concerning the system that injects rotons into the LHC. At a ceremony on 9 May, a major ew linear accelerator, Linac 4, was nangurated. Replacing Linac 2, which had een in service since 1978, it is CERN's

News

Intergenieve response to the constraint of the been in service since 1978, it is CERN's newest accelerator acquisition since the LHC and is due to feed the accelerator complex with higher-energy particle beams. After an extensive testing period, Linac 4 will be connected to the existing infrastructure during the long technical shutdown in 2019/2020.

ntdown in 2019/2020. To cope with the higher-intensity and gher-energy beams emerging from nac 4, the Proton Synchrotron Booster 'SB1, which is the second accelerator of

e LHC injector chain, will be completely

overhauled during that same period. At the beginning of June, the first radio-frequency carky of the new PSB acceleration system wascompleted, with a further 27 under assembly. The new cavities are based a composite magnetic material called FINEMET developed by Hitachi Metals, which allows them to operate with a last set operation with the se

(Left) A view of the PI-Mode Structure (PIMS) cavities, which will accelerate the Linac 4

with one of the FINEMET cavities that will allow more intense beams

to 160 MeV. (Right) Mauro Paoluzzi, project leader for the PSB R

Summary

- High power neutrino beam is a key for future neutrino programs
- J-PARC Neutrino Beam
 - 10-year running for T2K physics data taking since 2010
 - 500 kW stable operation achieved so far
- Future upgrade
 - J-PARC 1.3 MW upgrade (3.2x10¹⁴ protons/pulse and 1.16 s cycle)
 - Accelerator upgrades
 - Magnet PS, RF, etc
 - Neutrino beamline upgrade
 - Major upgrade during FY2021-2022 long shutdown
 - Horn replacement, Horn PS upgrade, new radio-active water disposal facility
 - Other upgrades around FY2025
 - Cooling capacity improvement, high-power target installation
- International cooperation to realize high power neutrino beam facility
