

SEARCHES FOR SUSY WITH LONG-LIVED PARTICLES IN ATLAS

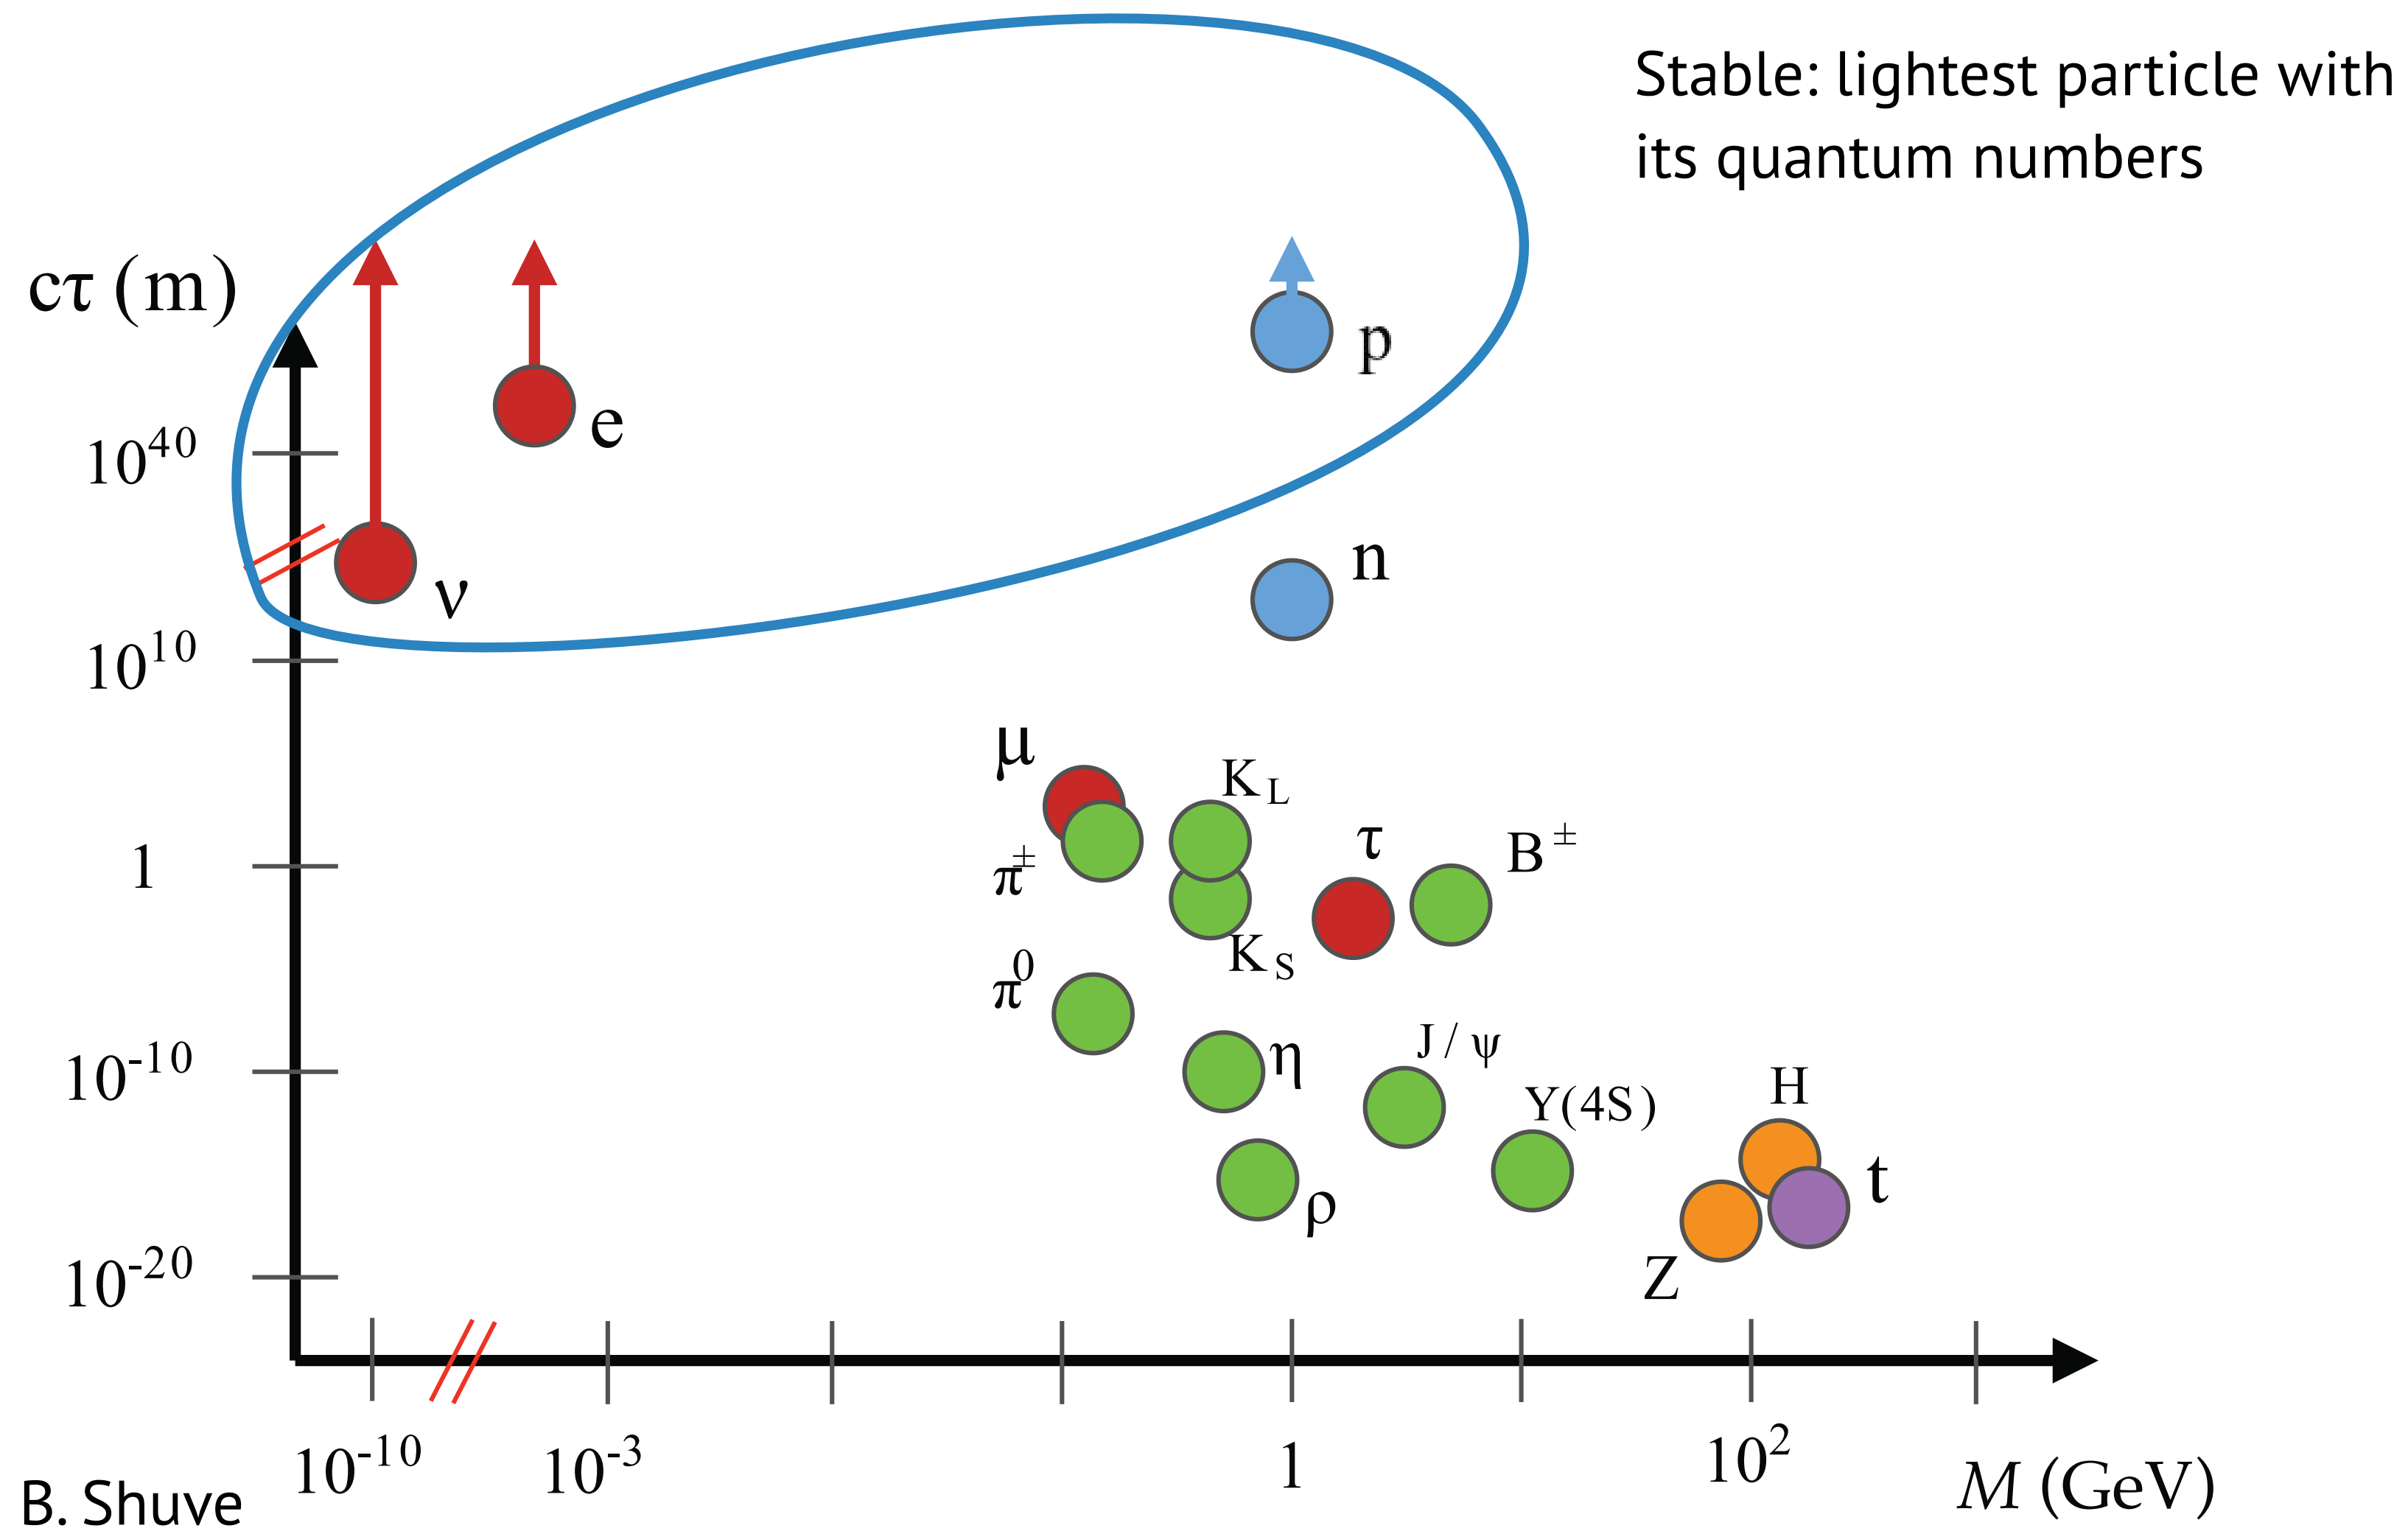

ICHEP 2020
July 29, 2020

Tova Holmes, on behalf of the ATLAS Collaboration

The standard model is full of “long-lived particles”

The standard model is full of “long-lived particles”

The standard model is full of “long-lived particles”

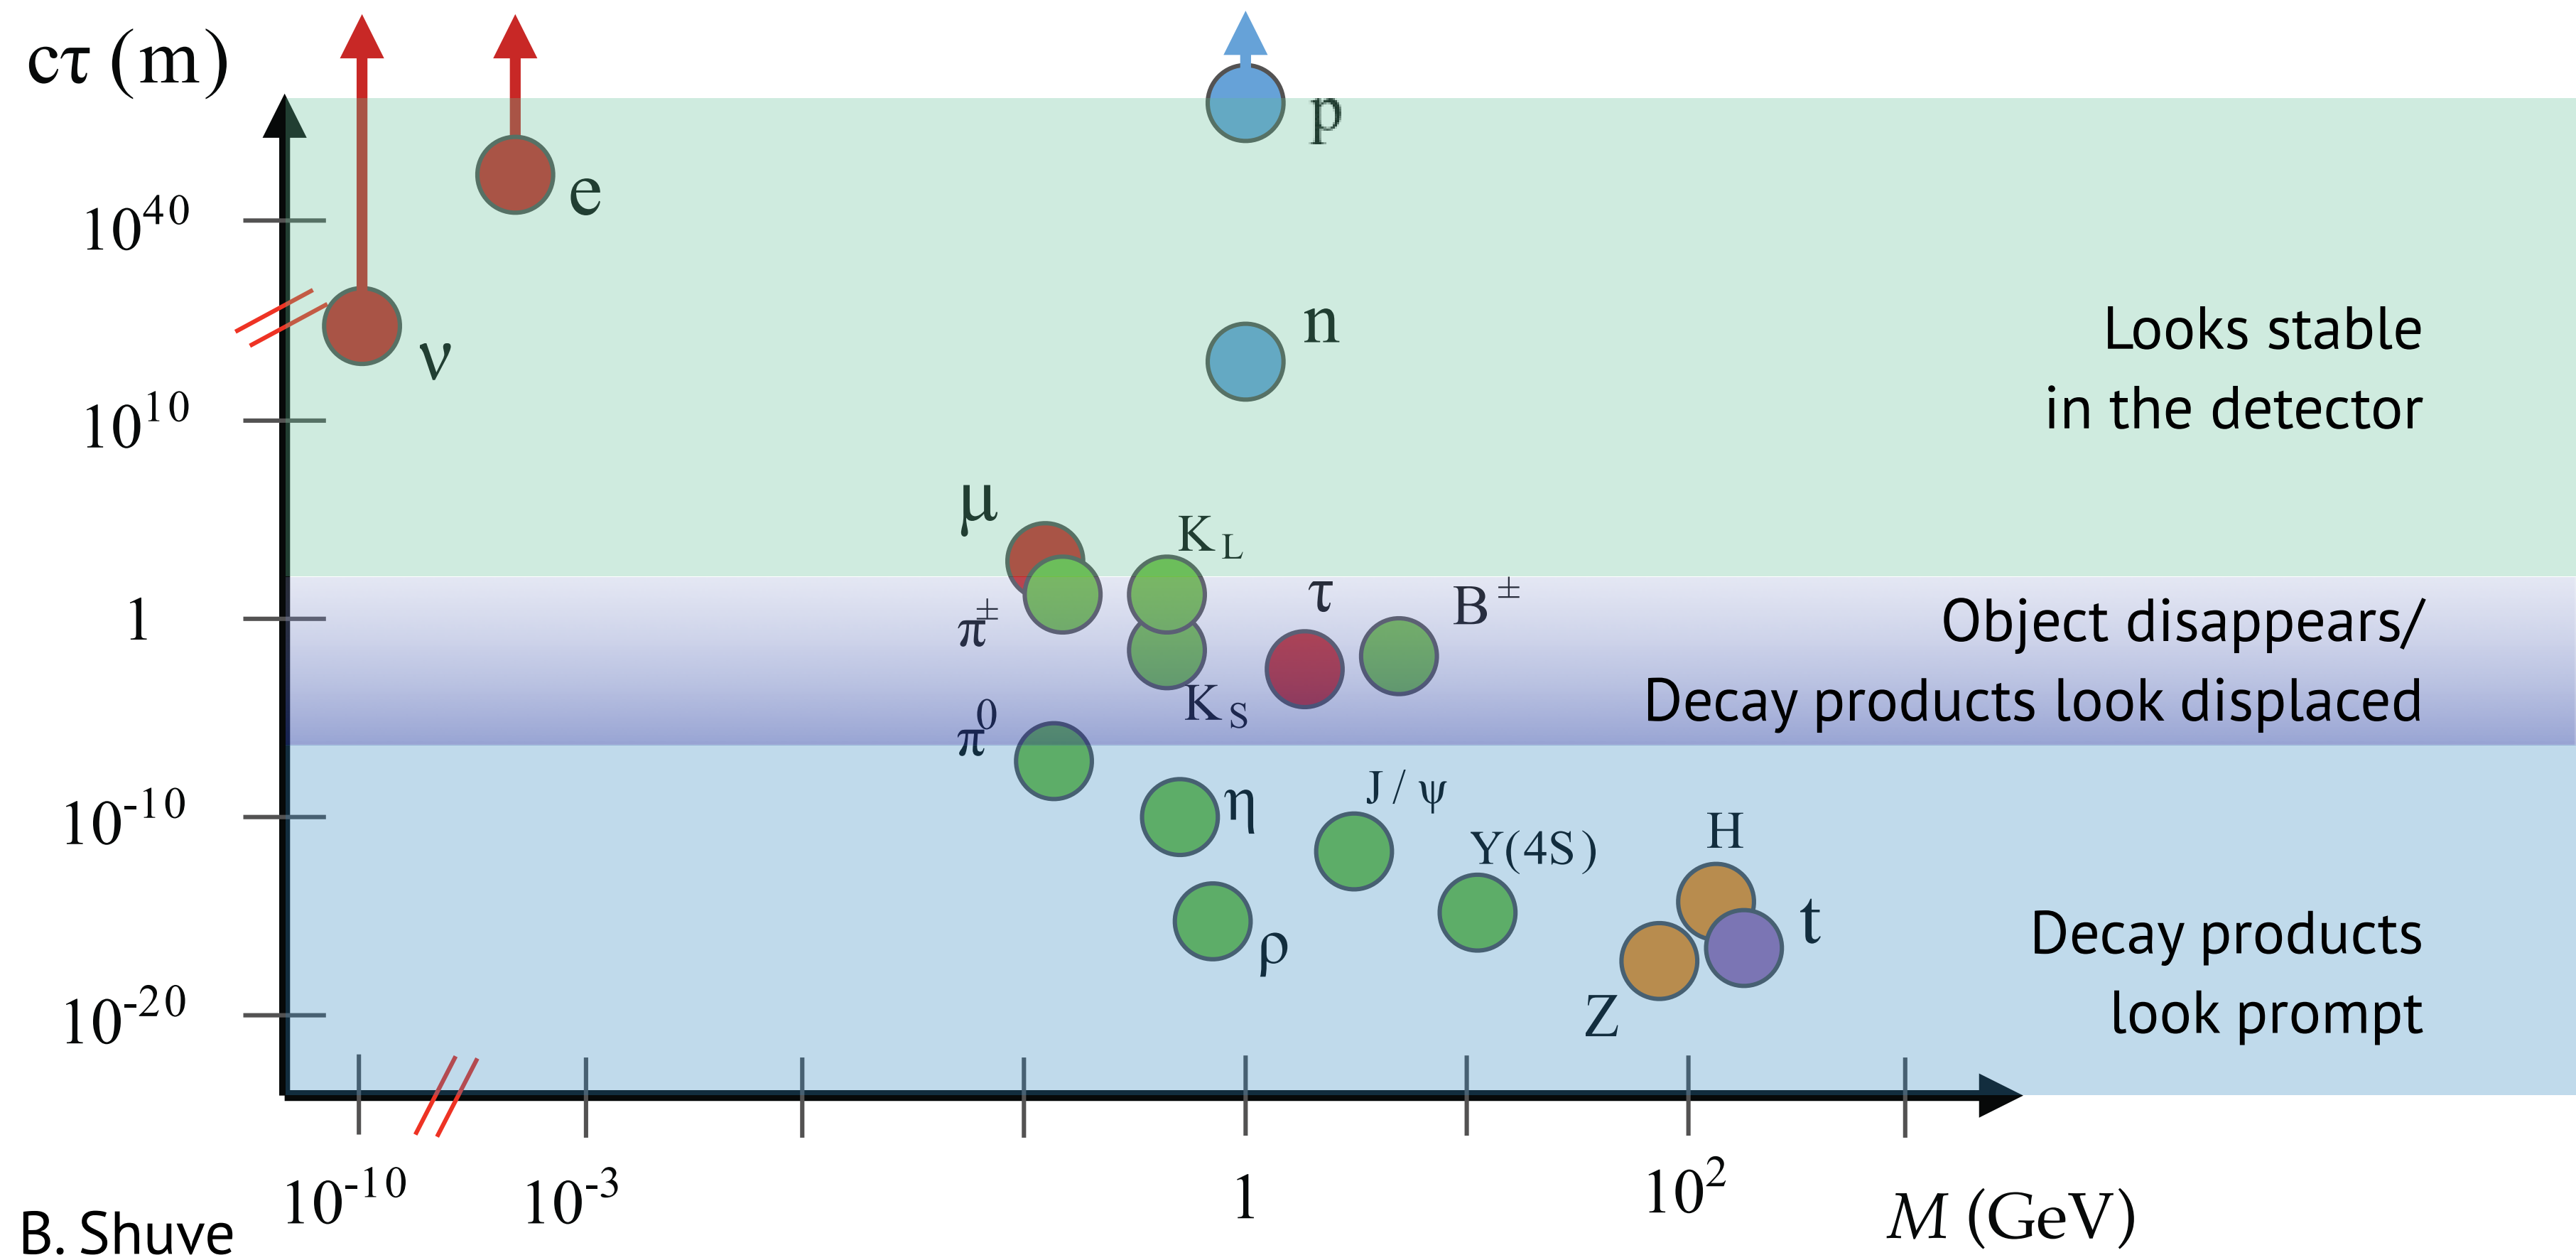

The standard model is full of “long-lived particles”

The standard model is full of “long-lived particles”

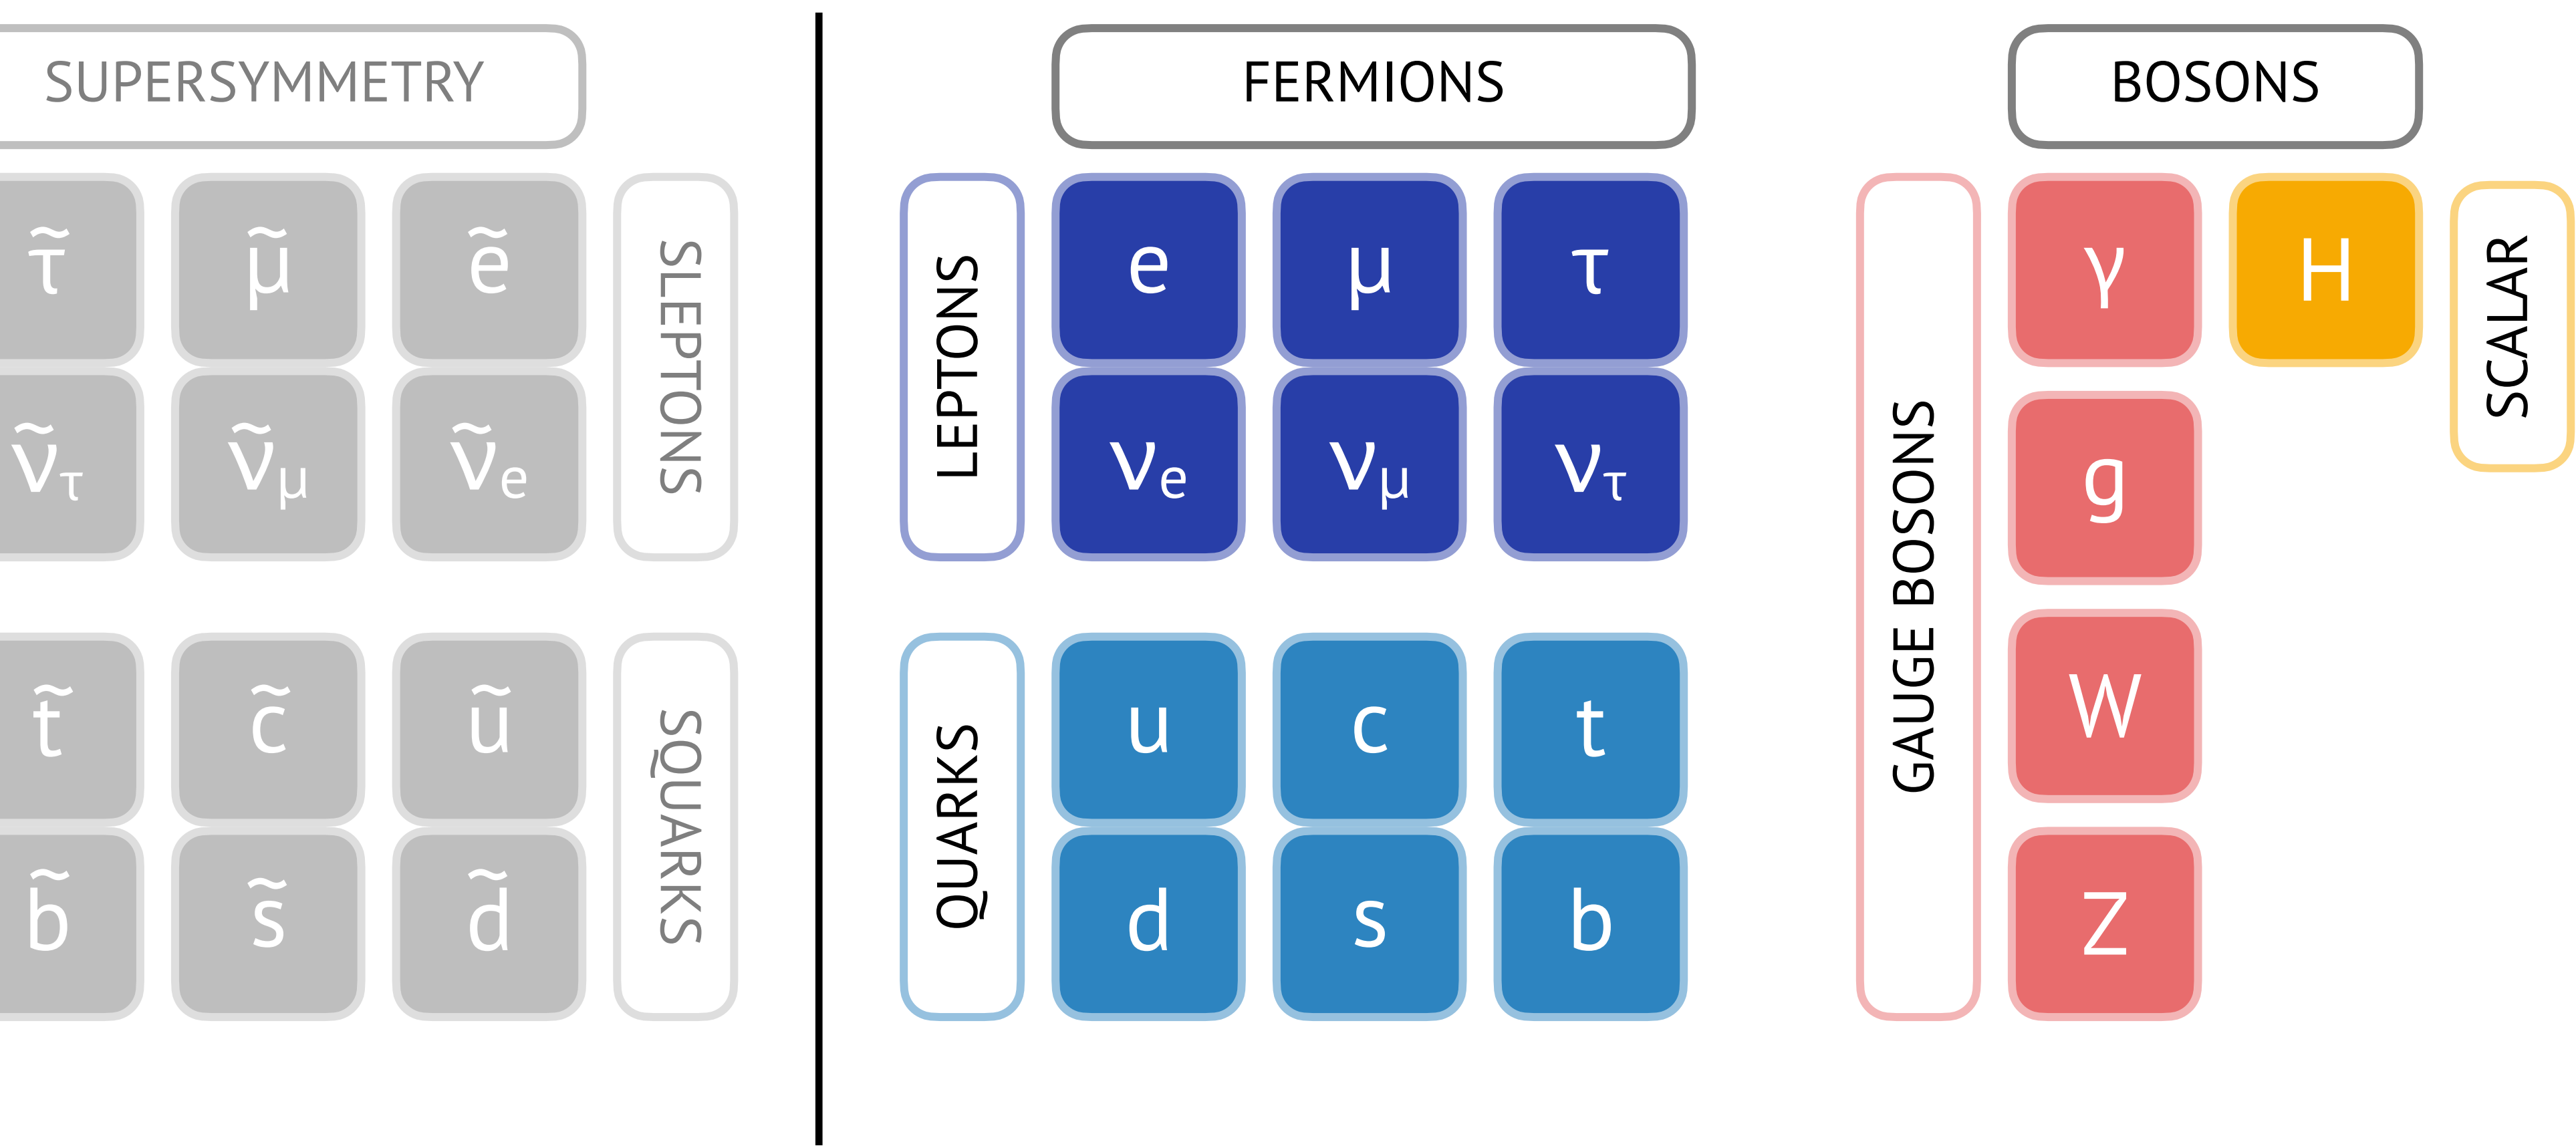

From the experimental point of view...

No reason to think there are only Standard Model long-lived particles...

Beyond-the-Standard-Model particles can be long-lived for the same reasons (small mass splittings, small couplings, virtual mediators)

Happens in all kinds of theories of new physics, but I'll focus on one: **SUPERSYMMETRY**

No reason to think there are only Standard Model long-lived particles...

Beyond-the-Standard-Model particles can be long-lived for the same reasons (small mass splittings, small couplings, virtual mediators)

Happens in all kinds of theories of new physics, but I'll focus on one: **SUPERSYMMETRY**

Tiny Couplings

Gauge Mediated Symmetry Breaking

Small Mass Splittings

Anomaly Mediated Symmetry Breaking

Virtual Mediators

Split Supersymmetry

Why we love SUSY

Gives a solution to the **hierarchy** problem

Gives a **dark matter** candidate

Is a particularly **elegant** mathematical concept

Gives rise to many different particles with complex and ~unpredictable mass spectra
(keeps us employed for decades)

Why we don't love SUSY

Happens in all kinds of theories of new physics, but I'll focus on one: **SUPERSYMMETRY**

Why we love SUSY

Why we don't love SUSY

We thought it would be easier to find

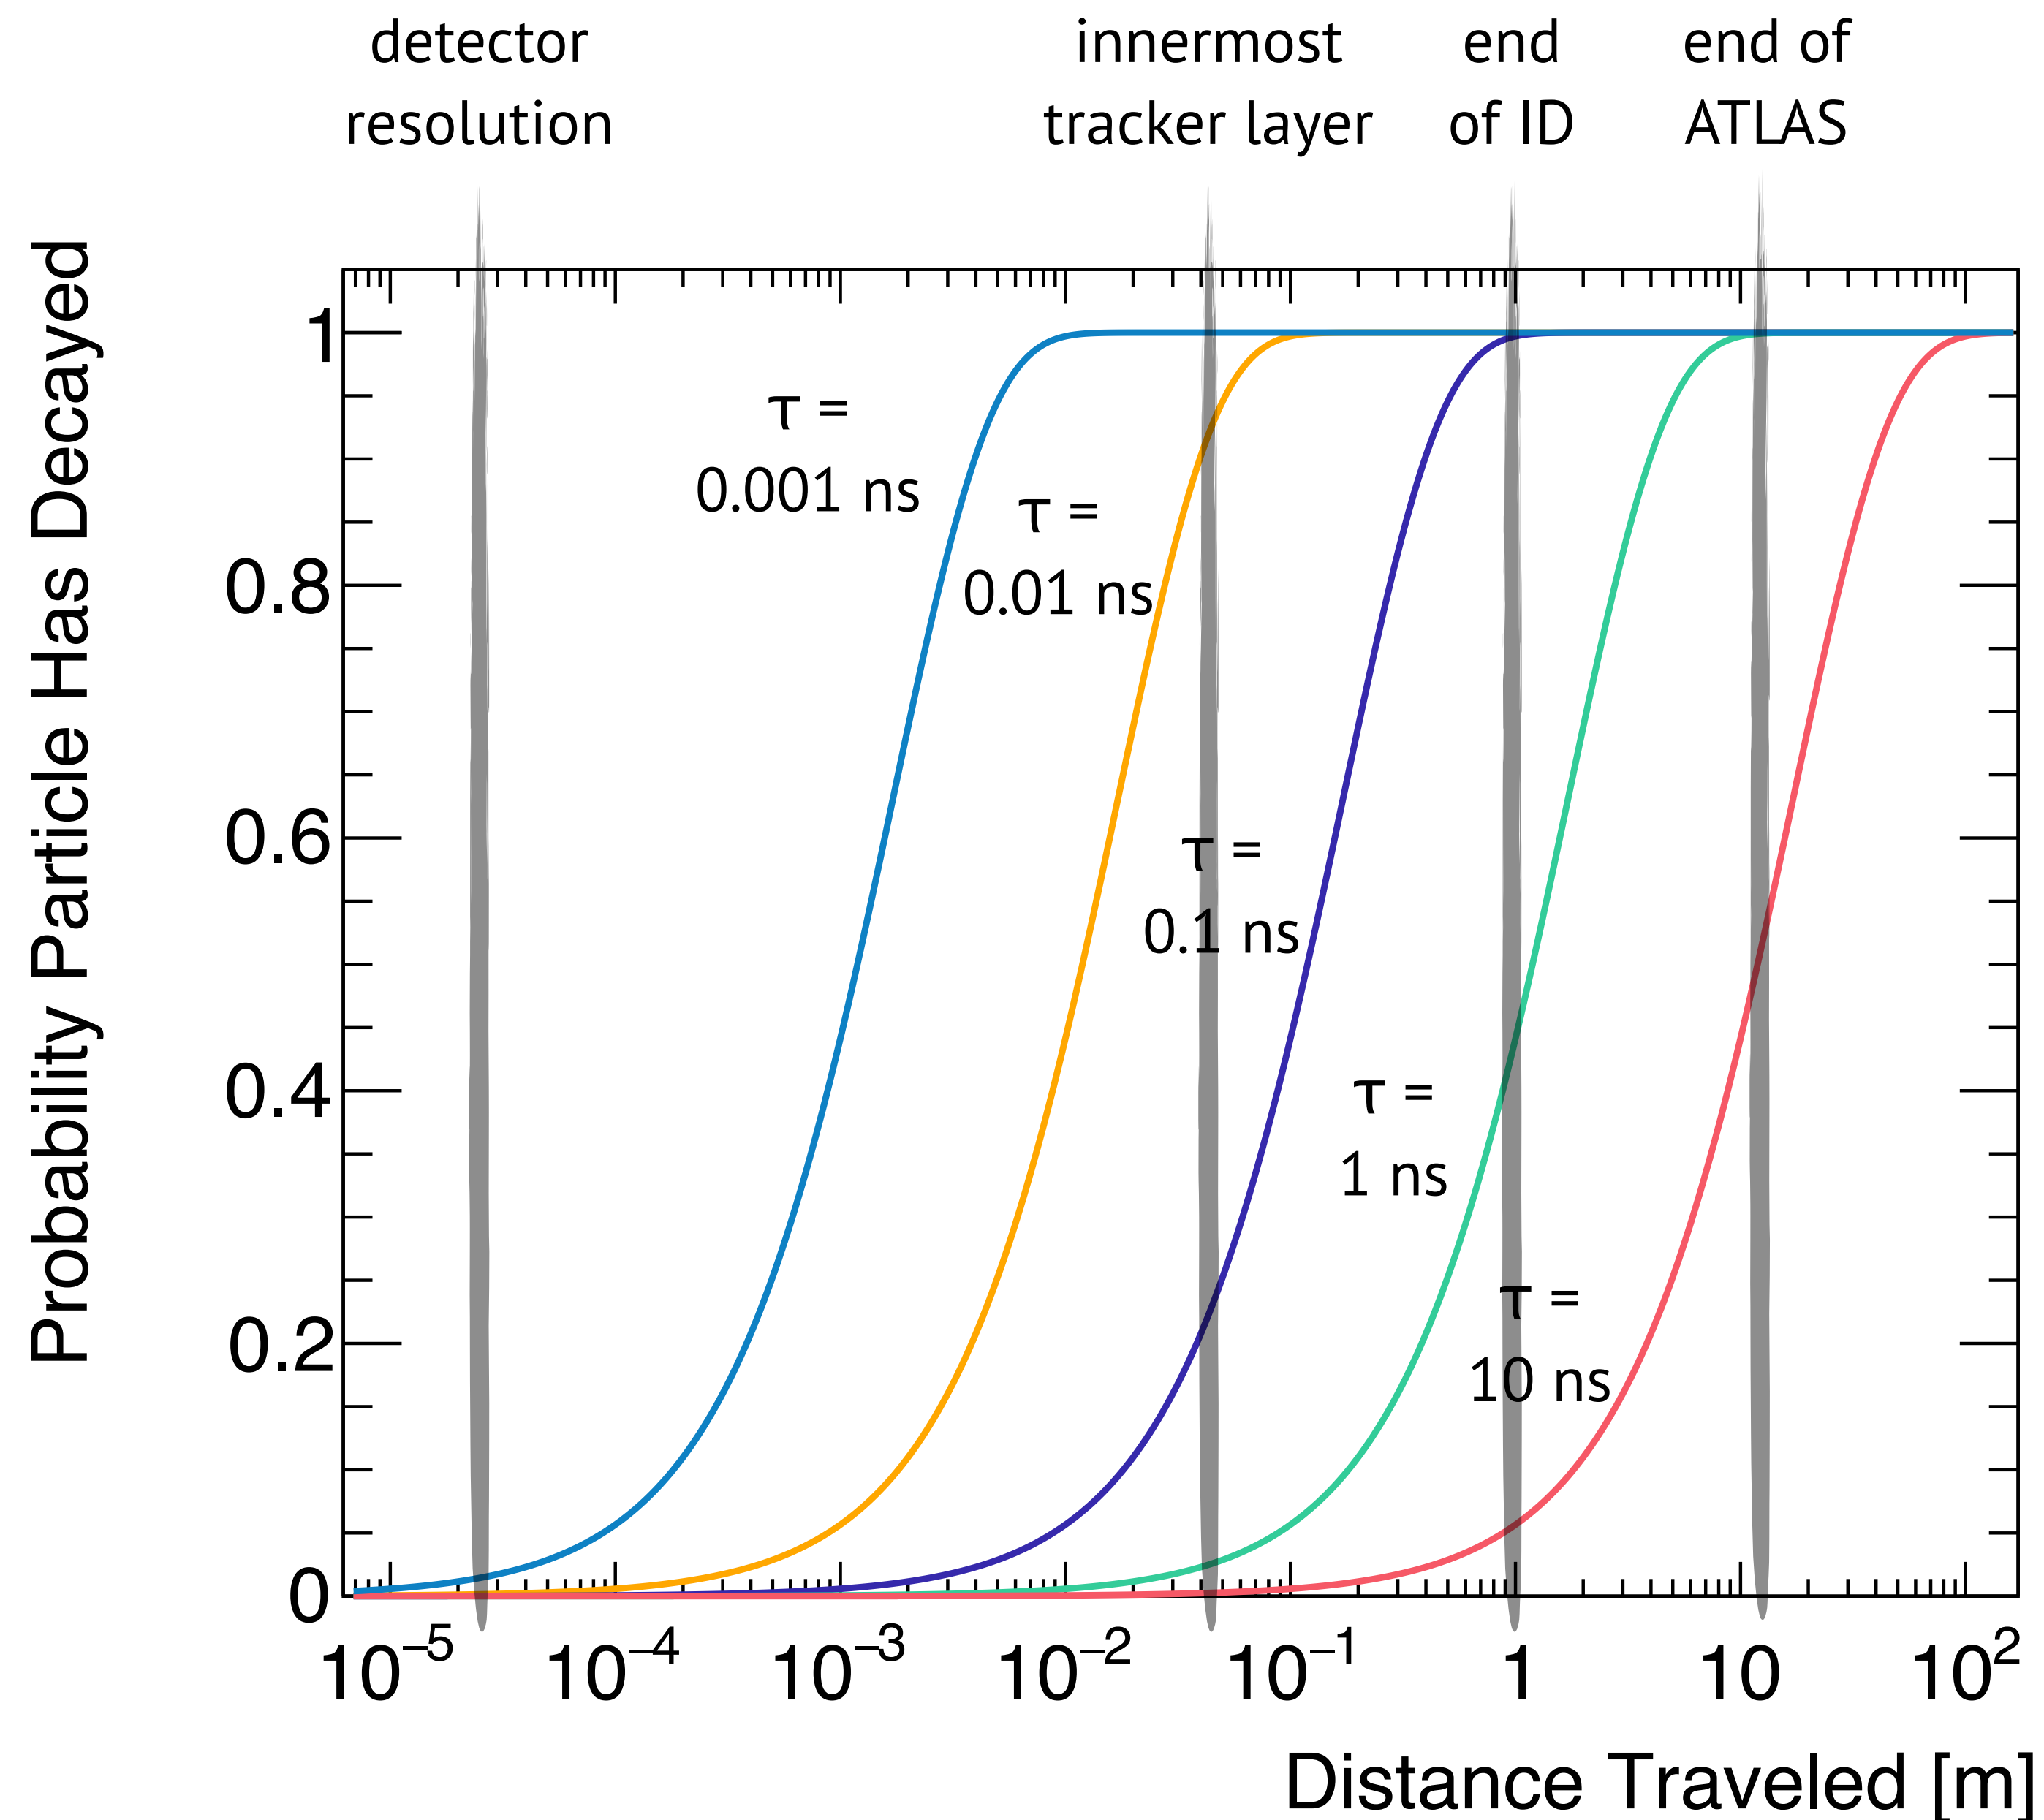

What makes lifetime hard?

Varying lifetime creates completely different **signatures** in our detector

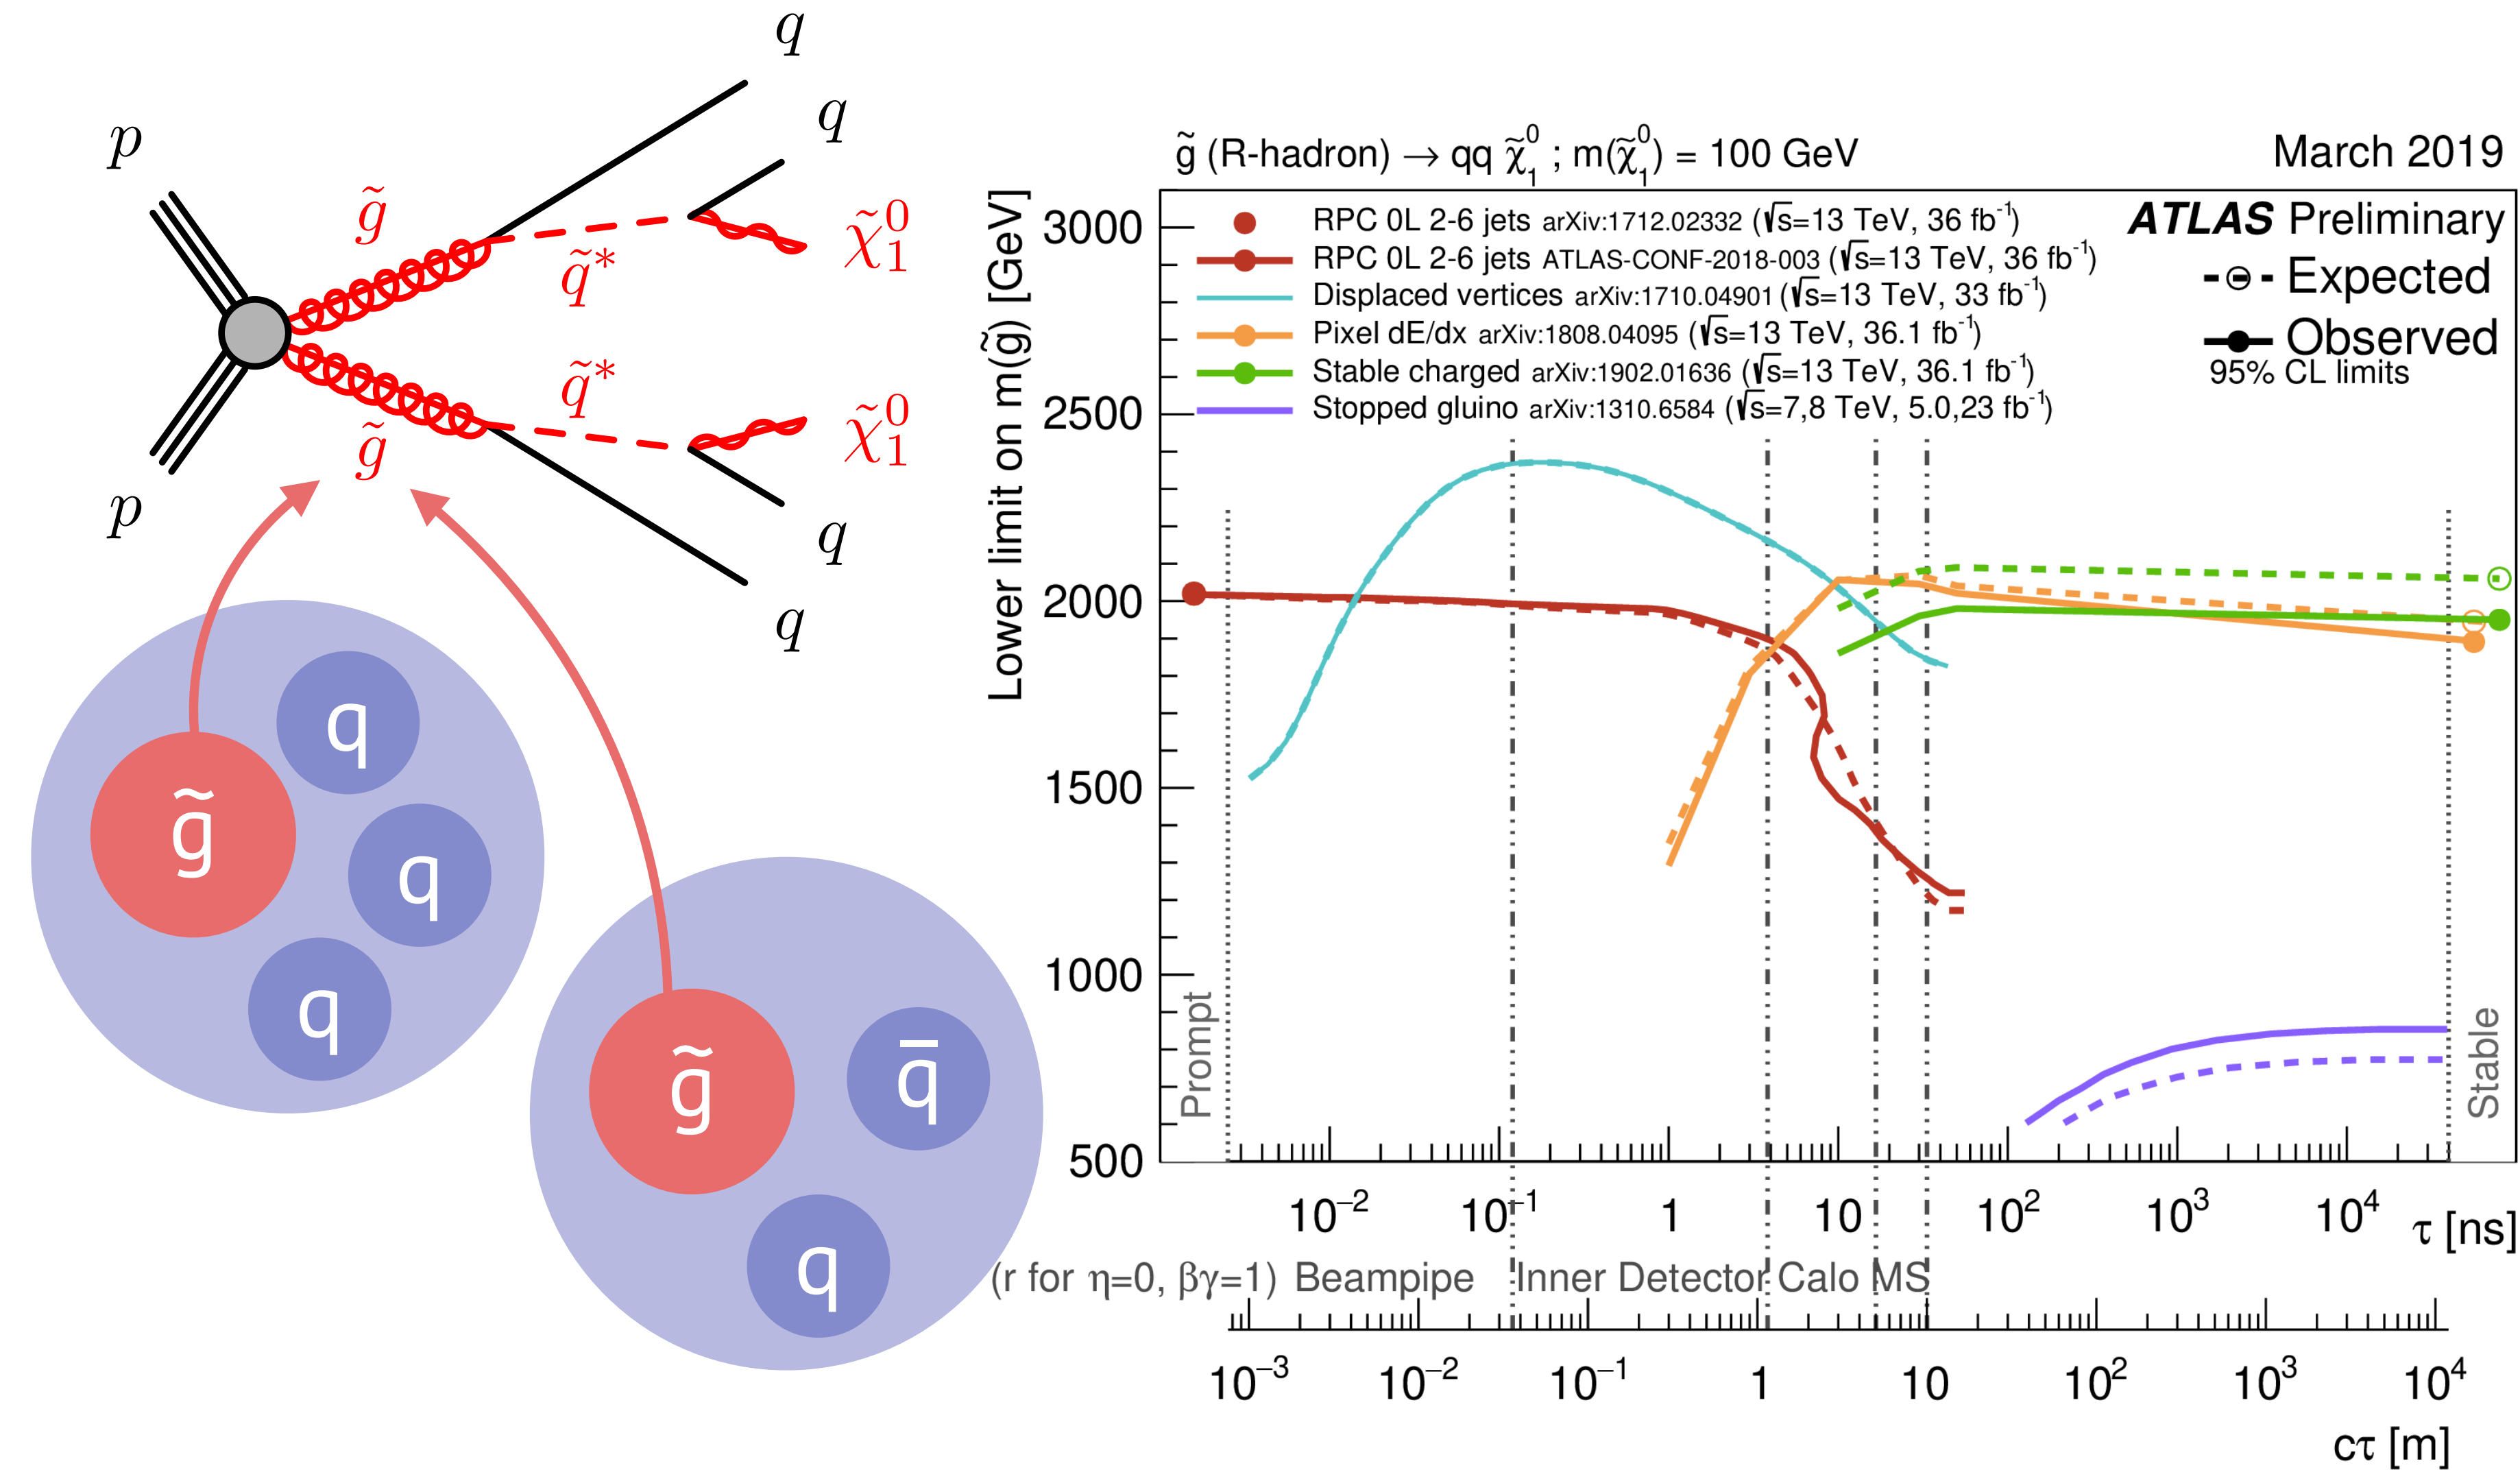

Many of those variations include signatures we **didn't design ATLAS** to reconstruct

Must have **dedicated** searches for each signature – adds a **new dimension** to the types of searches we need to cover SUSY scenarios!

200 GeV particle
energy: 500 GeV

How do we cover the lifetime space?

To cover the full space:

- Prompt jet search
- Displaced vertex search
- Highly ionizing track search

Adding a lifetime dimension adds a new dimension of searches that need to be done!

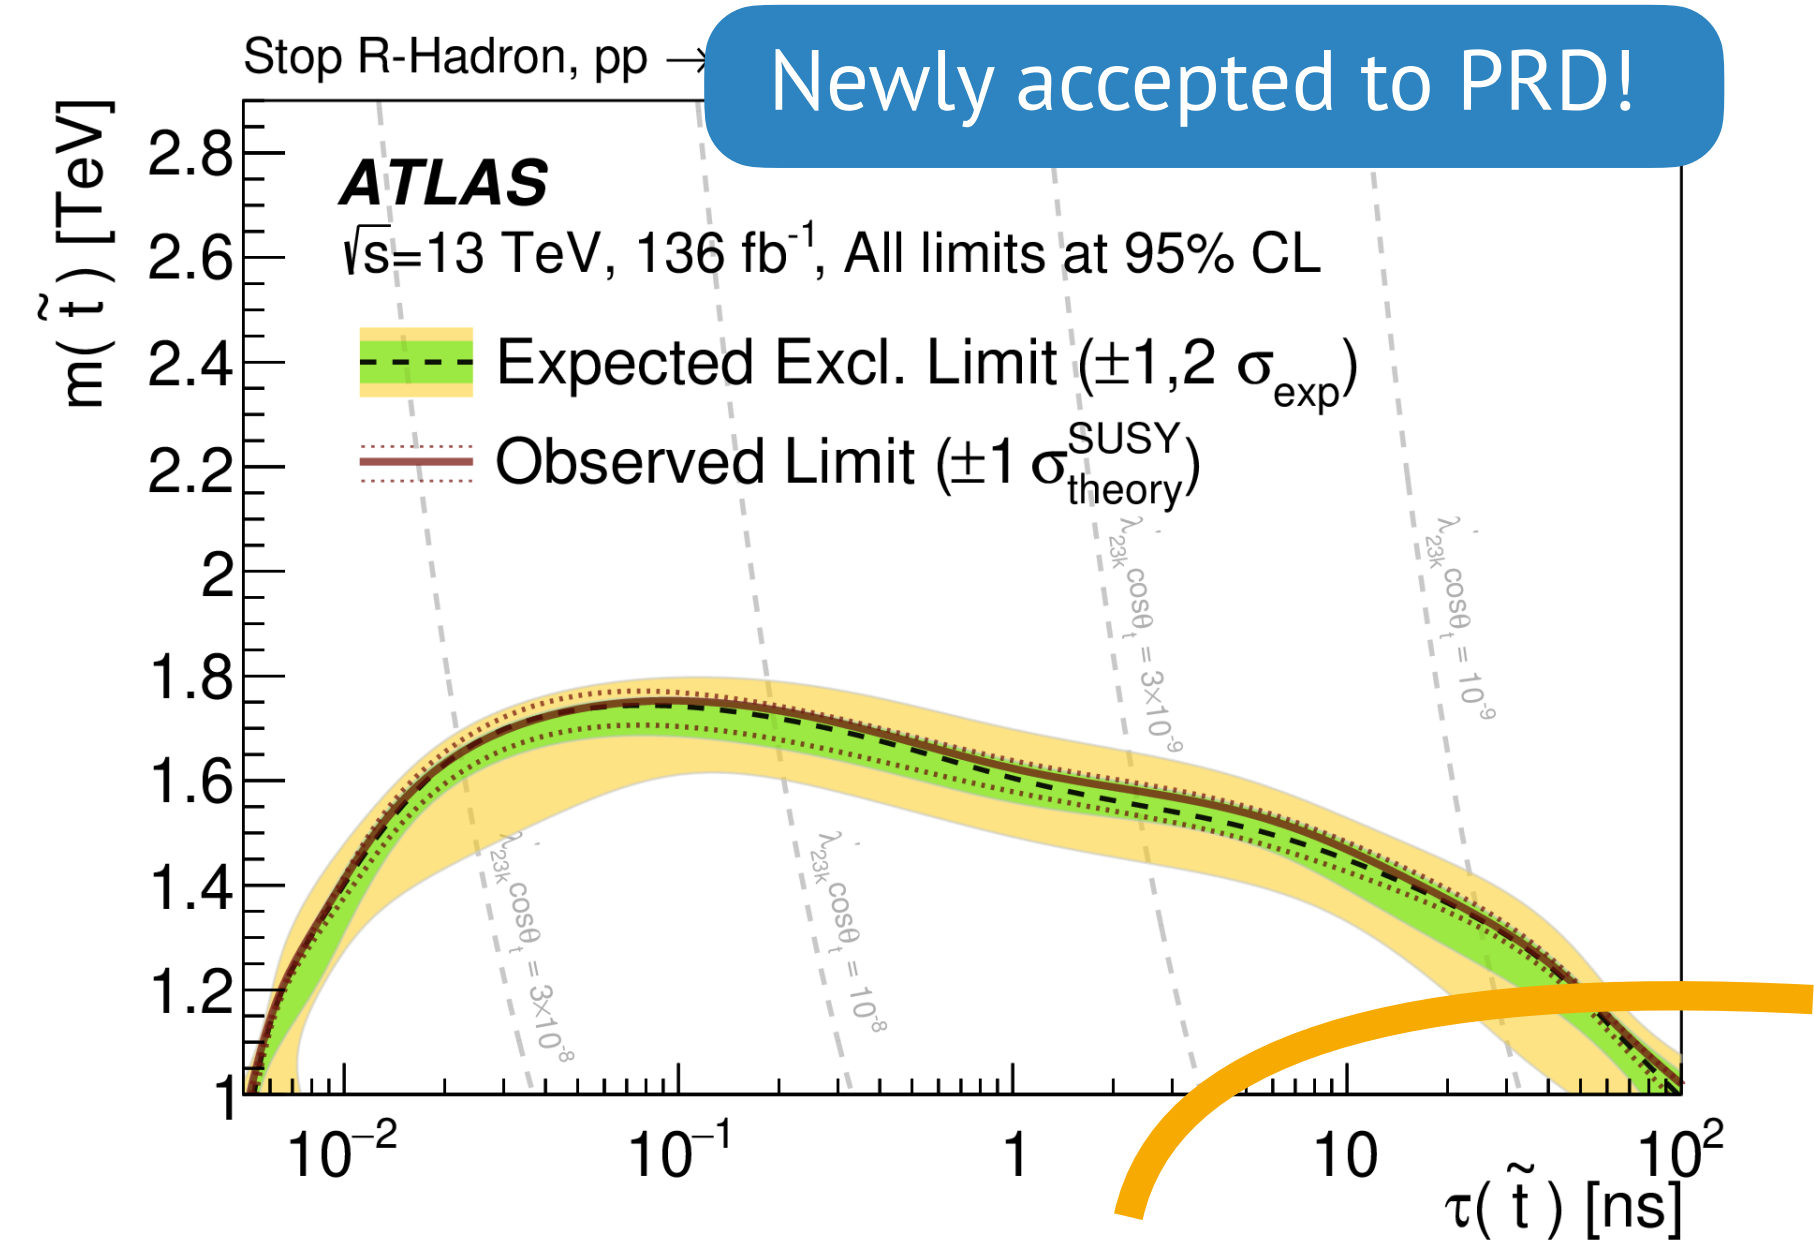

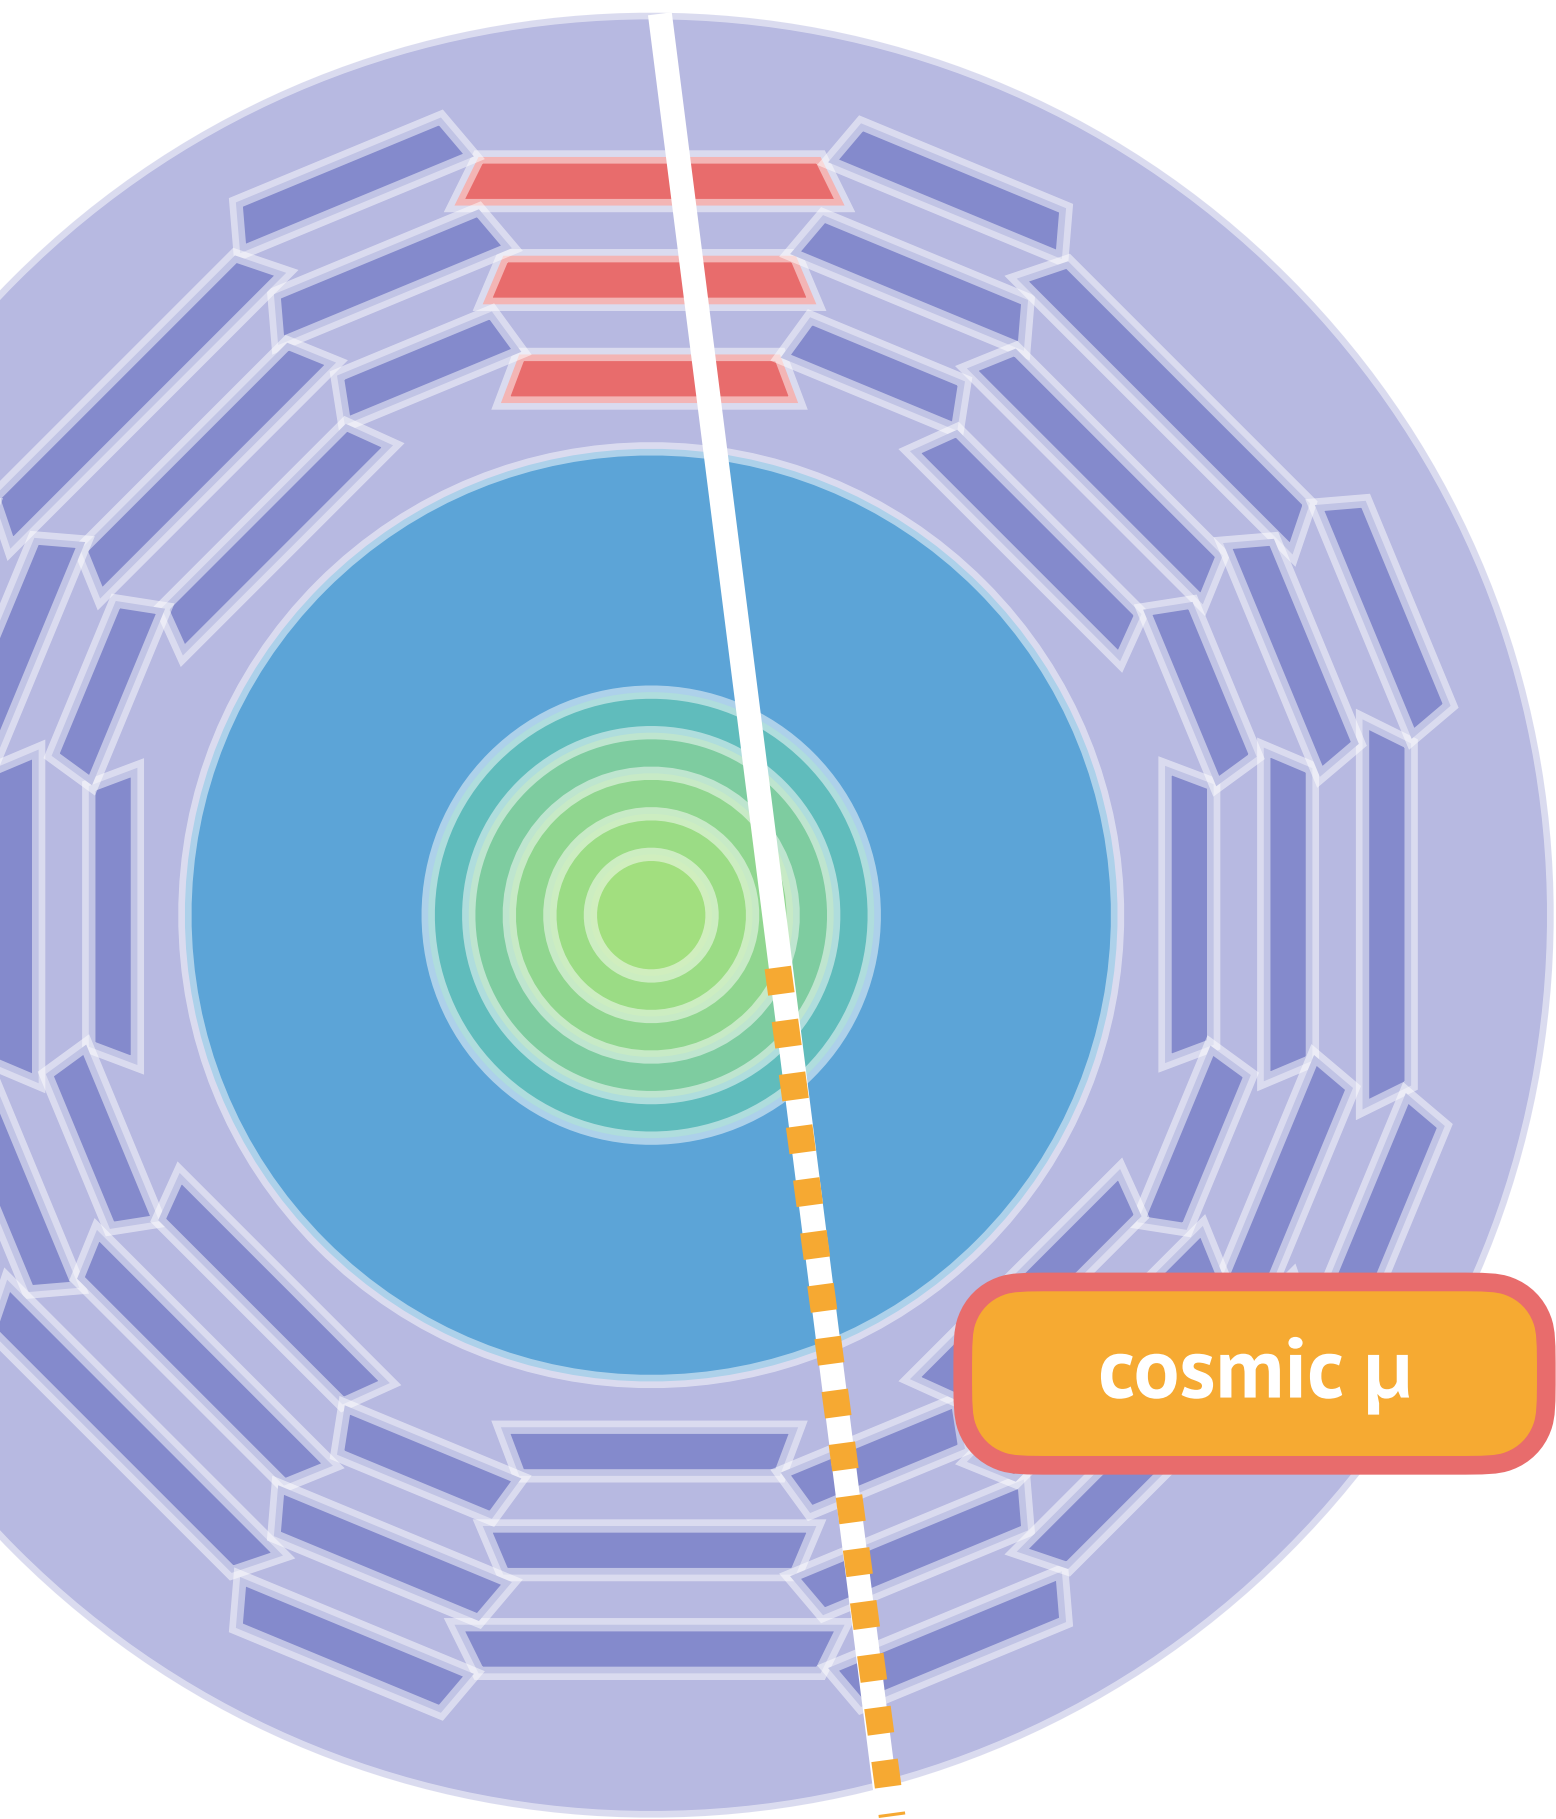

And not all models have been as thoroughly covered

Now repeat for different objects...

Take a very similar model – still produces an R-hadron, but has muons and fewer jets
Large lifetime can be covered similarly: **highly ionizing tracks**
Smaller lifetimes need new strategy : **displaced muons** (+ displaced vertices)

Now need to handle a new background: **cosmic rays**
Developed a highly efficient tag to bring down backgrounds

Now repeat for different objects...

Adding **electrons** to a signature further complicates the search

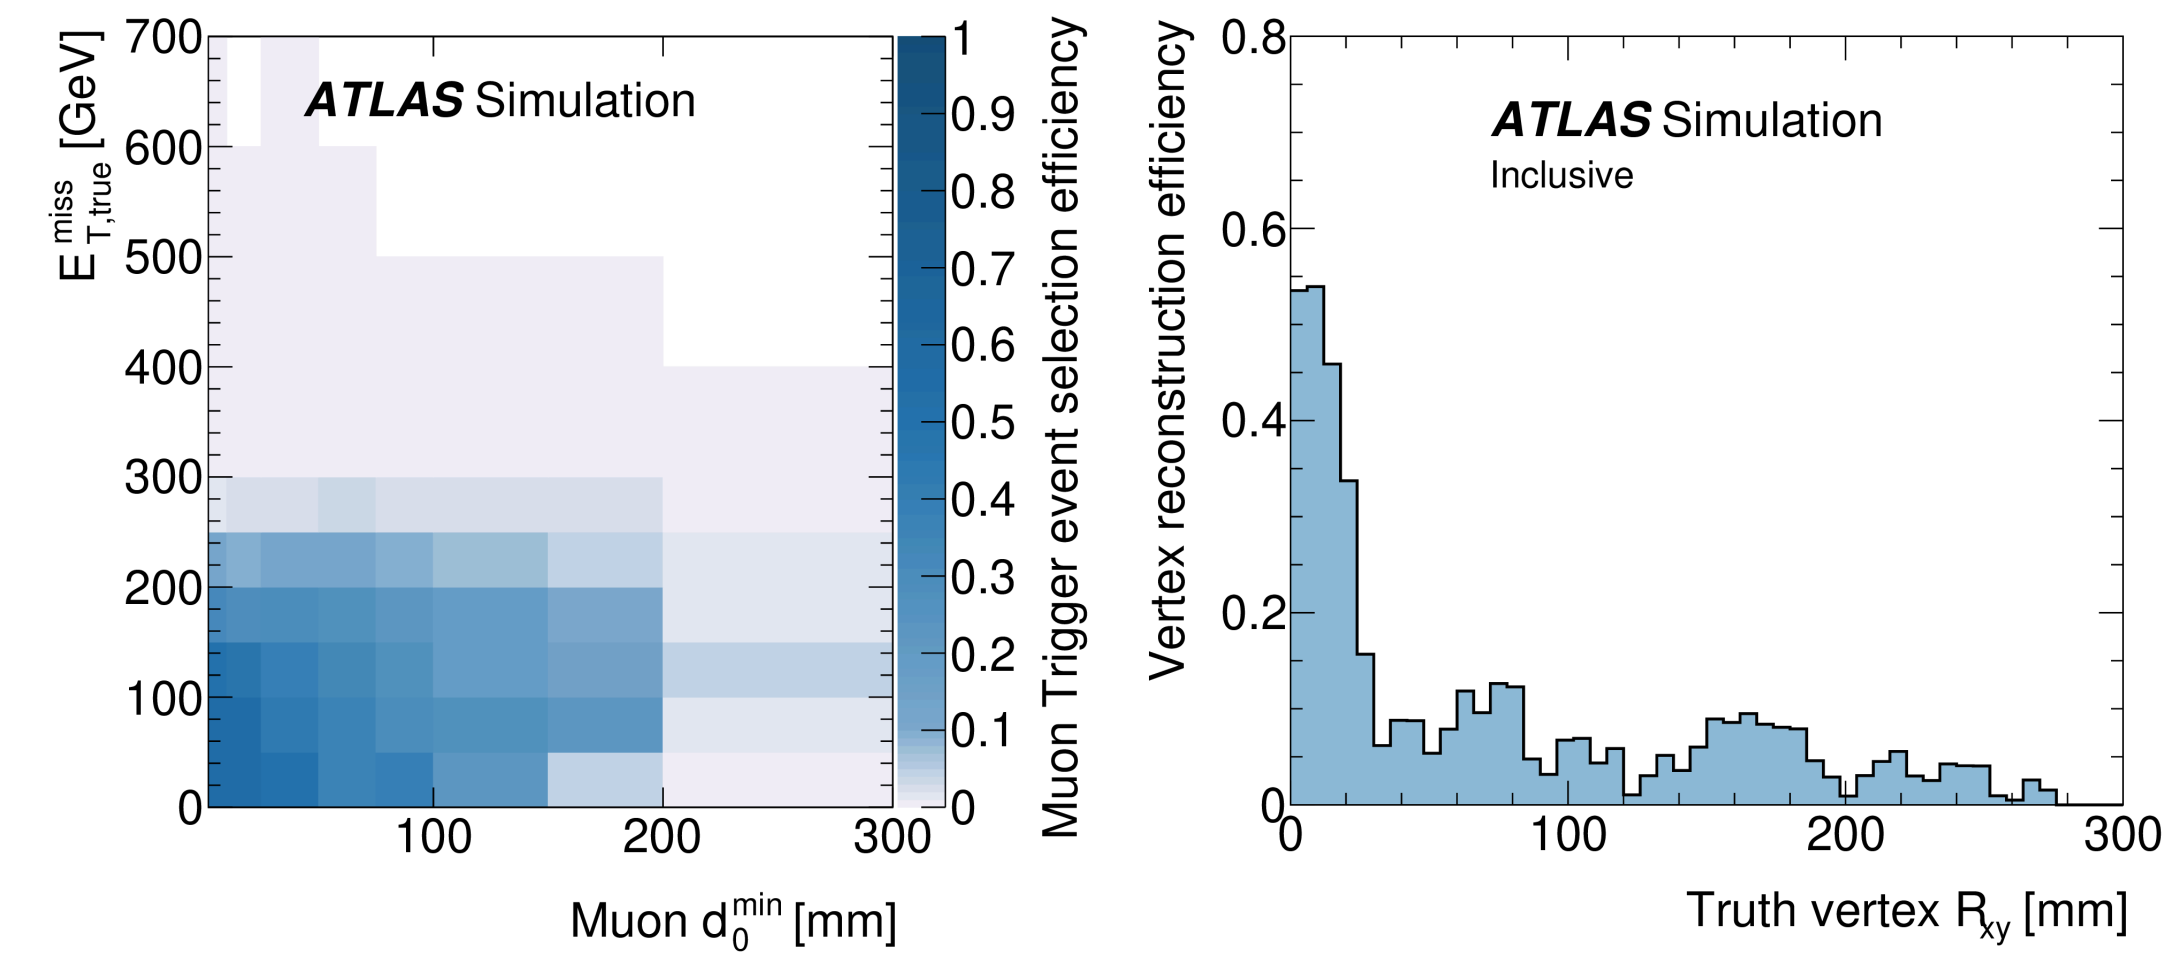

μ: **clean** signatures, little bremsstrahlung, few fakes

e: lots of ID and calo activity, brems and conversions **create displaced electrons!**

Used a likelihood-based identifier for electrons that didn't depend on d_0 , pixel hits, or other displacement-dependent quality parameters

Not just lots of signatures...

Signatures tend to be generic— can apply to **MANY** models

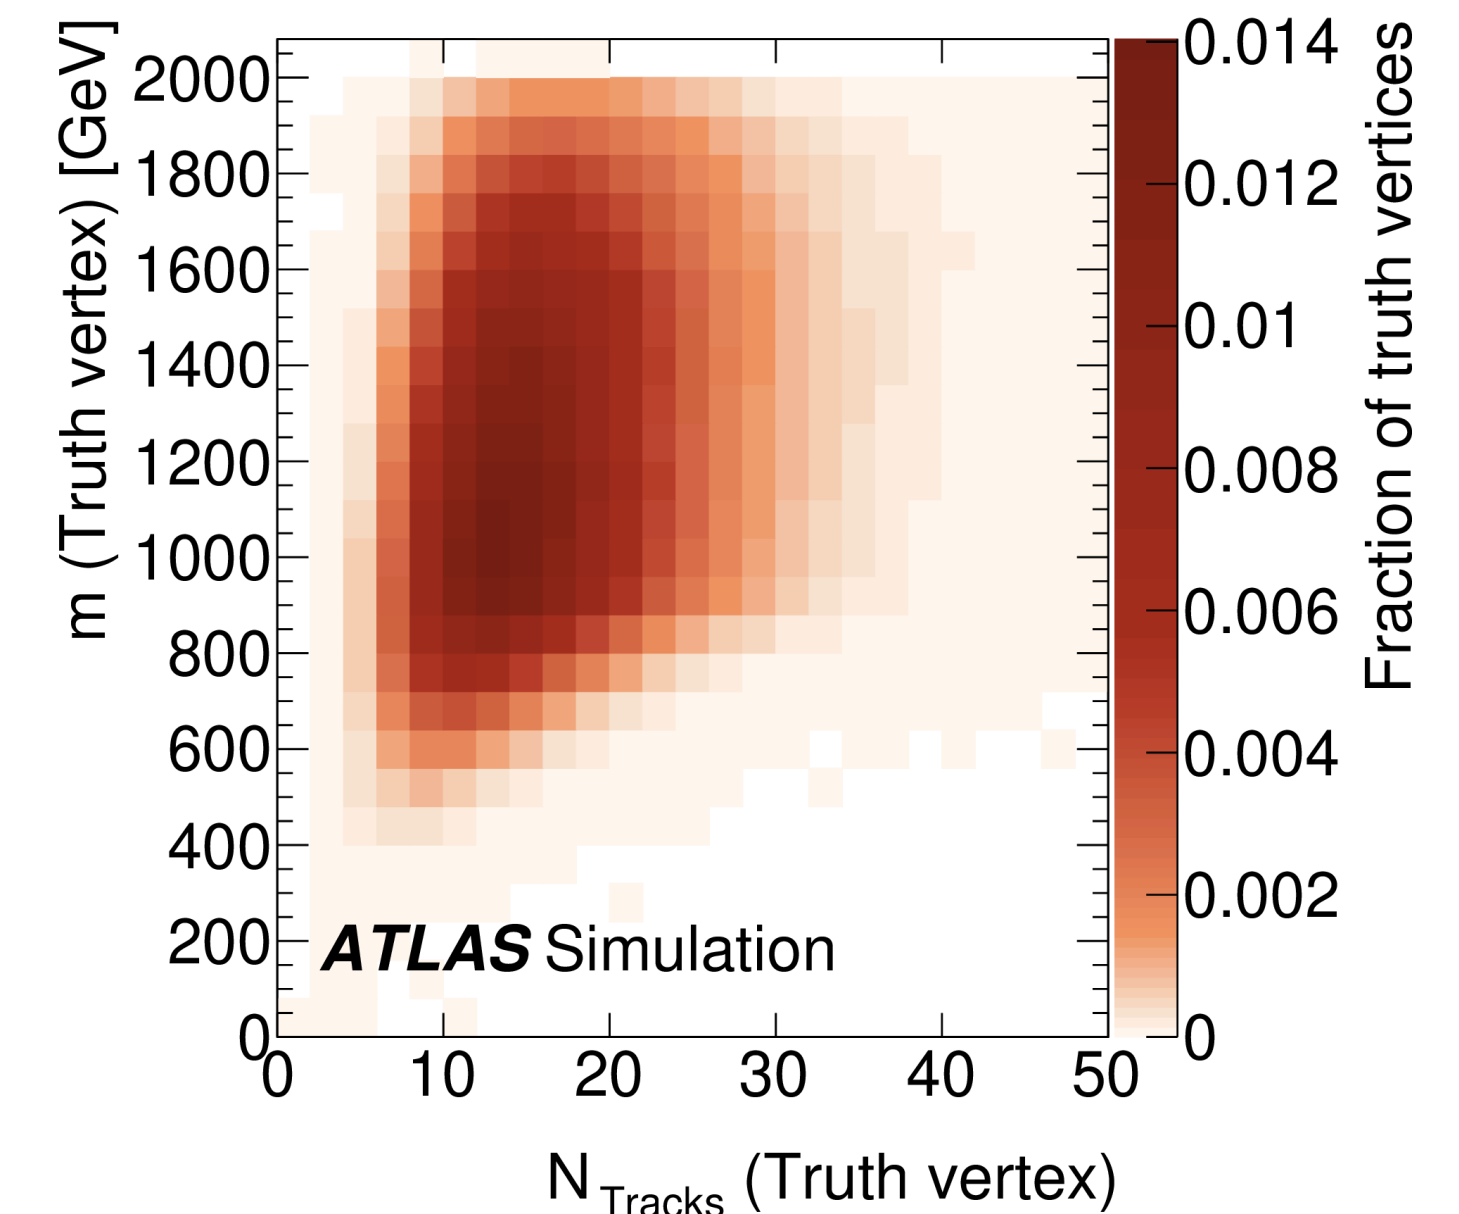

But not possible to interpret in all of them

LLP grids often very substantial due to extra lifetime dimension

But hard to re-interpret: strong efficiency dependences on many variables

Provide many multi-dimensional **efficiencies**
and **kinematic distributions** for models used

Strategy enthusiastically embraced by theorists!

Can we do it better in-house?

Even better, have recently been able to use [RECAST](#) to re-interpret an LLP result with a new SUSY model

RECAST lets us preserve background estimates, signal sample processing, cutflow
→ if a new model is thought of later, can simply run over and produce new limits

Displaced Jets Search

Identifies unusual activity in the calorimeter
Complex BDT based identification
– very hard to parametrize!

New limits placed on a stealth SUSY model!

[ATL-PHYS-PUB-2020-007](#)

Conclusions

Long-lifetimes are a **common feature** of SUSY models
Means more **unique** searches are required
Exotic object based searches are **broadly applicable**
But very challenging to **re-interpret**

Lots of recent work done with **parameterization**
and **RECAST** to make this possible

Of course, reinterpretation materials can't do all the work
Can't cover new signatures!

Many more novel ATLAS LLP searches on the horizon
Stay tuned!

**THANK
YOU!**
