Hyper-Kamiokande

Long-baseline neutrino oscillation sensitivities with Hyper-Kamiokande

Mark Scott for the Hyper-Kamiokande Collaboration

Hyper-Kamiokande Long-Baseline Physics 29th July 2020

Hyper-Kamiokande project is approved!

KEK will upgrade and operate J-PARC to produce 1.3 MW neutrino beam

The University of Tokyo will construct and operate the Hyper-Kamiokande Detector

- Construction has begun
- Operation will begin in 2027

Hyper-Kamiokande Long-Baseline Physics 29th July 2020

Water Cherenkov detectors in Kamioka

Hyper-Kamiokande Long-Baseline Physics 29th July 2020

Water Cherenkov detectors in Kamioka

- Cherenkov ring from charged particles
- >99% μ/e separation
- Momentum and direction reconstruction

Hyper-K

OD talk by S. Zsoldos:

Fri July 31, 11:45

Imperial College London

Hyper-Kamiokande experiment

- Factor 20 increase in statistics compared to T2K:
 - Upgrade of the J-PARC neutrino beam to 1.3 MW
 - New far detector with 188kt fiducial volume
- New intermediate detector and inherited upgraded near detectors
- Improved photosensors with twice the quantum efficiency

Hyper-Kamiokande Long-Baseline Physics

29th July 2020

Talks by: T. Tashiro, Fri July 31, 10:45 G. De Rosa, Fri July 31, 11:00

J-PARC Accelerator Complex

Neutrino oscillations

 Measure flavour composition of beam as function of L / E

$$P_{\alpha \to \beta} = \left| \sum_{i} U_{\alpha i}^{*} U_{\beta i} e^{-im_{i}^{2}L/2E} \right|^{2}$$

 Compare neutrino beam and antineutrino beam to test CP symmetry

Mark Scott, ICHEP 2020

Imperial College London

Hyper-Kamiokande Long-Baseline Physics 29th July 2020

Neutrino oscillation formalism

$$U = \begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix} \begin{pmatrix} c_{13} & 0 & s_{13}e^{-i\delta} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta} & 0 & c_{13} \end{pmatrix} \begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

$$\overline{c_{ij} = \cos \theta_{ij}}_{ij}$$
• Three mixing angles, θ_{12} , θ_{23} and θ_{13}
• Two mass splittings, Δm^2_{12} and Δm^2_{23}
• One CP-violating phase, δ_{CP}
• Normal Inverted

Mark Scott, ICHEP 2020

 $(\mathbf{m}_{\mathbf{v}})$ Inverted Normal

Neutrino oscillation formalism

 $U = \begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix} \begin{pmatrix} c_{13} & 0 & s_{13}e^{-i\delta} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta} & 0 & c_{13} \end{pmatrix} \begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix}$ $\frac{\partial s \theta_{ij}}{\partial t_{ij}} \qquad Mass^{-1} \qquad m_{3}$ Is θ_{23} above or below 45° (octant)?
What is the neutrino mass ordering?
What is the neutrino mass ordering? $\frac{2.5 \times 10^{-5} \text{ eV}^{2}}{7.6 \times 10^{-5} \text{ eV}^{2}} \qquad m_{0}$ $c_{ij} = \cos \theta_{ij}$ $s_{ij} = \sin \theta_{ij}$

Hyper-Kamiokande electron-like event samples

Imperial College London HK Oscillation Analysis

Based on T2K analysis method

Hyper-Kamiokande Long-Baseline Physics 29th July 2020

Systematic uncertainties

High statistics experiment, limited by systematics

- NA61/SHINE thin-target hadron-production data
- J-PARC neutrino beamline uncertainties

- NEUT 5.4 and T2K 2018 uncertainty model as baseline (<u>Nature</u> volume 580, pages339–344(2020))
- Nucleon removal energy
 uncertainty included directly
- Use T2K near detector fit to provide initial constraint on model uncertainties
- Scale uncertainties to expected Hyper-K near detector performance

Lifting the $sin^2\theta_{23}$ degeneracy

- All analyses assume 10 years of HK data
 - 1:3 ratio of neutrino beam to antineutrino beam
 - Not including atmospheric neutrino sample
- Wrong octant exclusion versus true value of $\sin^2 \theta_{23}$
- Estimated systematic uncertainty on muon sample reduced from 4.6% to 1.9% with improved near detectors
- Achieve 3σ exclusion for:
 - $-\sin^2\theta_{23} < 0.47$
 - $-\sin^2\theta_{23} > 0.55$

CP violation sensitivity

Ability to exclude CP conservation versus true value of δ_{CP}

CP violation sensitivity

CP violation sensitivity

- Ability to exclude $\begin{bmatrix} \\ CP & conservation \\ versus true value \\ of \delta_{CP} \end{bmatrix}$
- Large electron-like samples provide high statistics
- Limited by systematics

CP violation sensitivity

- Ability to exclude $\begin{bmatrix} \\ CP & conservation \\ versus true value \\ of \delta_{CP} \end{bmatrix}$
- Large electron-like samples provide high statistics
- Limited by systematics
- Can exclude 60% of true δ_{CP} values at 5 σ

CP violation sensitivity over time

Percentage of true δ_{CP} values where CP conservation can be excluded as a function of running year

Hyper-Kamiokande Long-Baseline Physics

29th July 2020

CP violation sensitivity over time

- Percentage of true δ_{CP} values where CP conservation can be excluded as a function of running year
- Can achieve 3σ CP violation result over significant regions of δ_{CP} after 2 years operation

Hyper-Kamiokande Long-Baseline Physics 29th July 2020

 $(v_e)/(\bar{v}_e)$

cross-section

Adding atmospheric neutrinos

 Atmospheric neutrinos have longer baseline and higher energies – gives sensitivity to neutrino mass ordering

ь

- Plot shows sensitivity to CP violation versus true value of δ_{CP}
- If MO unknown, beam analysis less sensitive for some values of δ_{CP}
- Joint atmospheric and beam analysis increases sensitivity above 5σ
- Can exclude incorrect mass ordering at 4 – 6σ significance (depending on value of sin²θ₂₃)

Summary

- Updated Hyper-K long-baseline oscillation parameter sensitivities
- After 10 years data taking $\sin(\delta_{CP}) = 0$ exclusion $\langle V \Delta \chi^2$ HK will: 8 Hyper-K improved syst. (v_e/\overline{v}_e xsec. err. 2.0%) HK Exclude CP conservation at 5 σ for 60% of δ_{CP} parameter space - Reach 4 - 6σ Г2Кexclusion of the wrong mass ordering - Achieve 3σ exclusion of wrong octant for 2022 2024 2026 2028 2030 2032 2034 $\sin^2\theta_{23} < 0.47$ and Hyper-K preliminary $\sin^2 \theta_{23} > 0.55$ True normal hierarchy (known) $\sin^2(\theta_{13}) = 0.0218 \sin^2(\theta_{23}) = 0.528 |\Delta m_{32}^2| = 2.509\text{E-3} \ \delta_{CP} = -\pi/2$
- See talk by T. Yano, Thu 30 July, 10:30, for astrophysical neutrino sensitivities

Oscillation analysis fit

- Simultaneous likelihood fit of electron-like and muon-like samples at HK
- Profile systematics and oscillation parameters
- Fit electron-like samples in 2D (reconstructed energy vs lepton angle relative to the beam)
- Muon-like samples fit in 1D as function of reconstructed neutrino energy (assuming CCQE kinematics)
- Include flux and cross-section uncertainties using T2K 2018 near detector fit results
- Far detector uncertainties based on 2018 Super-K systematics

Scaled HK systematics

- Scale uncertainty on flux, cross-section and SK detector systematics by $1/\sqrt{N}$, where N = 8.7 is the relative increase in neutrino beam exposure from T2K to Hyper-K
- Studies from the ND280 Upgrade group (see talk #392 by D. Sgalaberna) and the HK Intermediate Water Cherenkov Detector were used to apply a further constraint to the cross-section model uncertainties:
 - A factor of 3 reduction on all non-quasi-elastic uncertainties
 - A factor of 2.5 reduction on all quasi-elastic uncertainties
 - A factor 2 reduction on all anti-neutrino uncertainties
 - A reduction in neutral current uncertainties to the ~10% level
- The electron neutrino / electron antineutrino cross-section ratio error was varied from ~3.6% to 1% to assess its impact
- No parameter was allowed to have an uncertainty of less than 1%
