A Supersymmetric Solution to the $R_{K^{(*)}}$ Anomalies

Thursday, 26 August 2021 17:20 (20 minutes)

The latest measurement of the ratio R_K at LHCb provides evidence for lepton flavour non-universal interactions beyond the Standard Model.

A popular extension of the Standard Model is the R-parity conserving Minimal Supersymmetric Standard Model (MSSM), however, it is widely claimed in the literature that an explanation of these anomalies is not possible within this model.

In this talk, I will show contrary to the claims that it is not only possible to relax the tensions, but also to explain the longstanding $(g-2)$ anomaly of the muon at the same time.
