Searches for charginos and neutralinos with the ATLAS detector

Tuesday 24 August 2021 17:20 (20 minutes)

Charginos and neutralinos are often the lightest new particles predicted by a wide range of supersymmetry models, and the lightest neutralino is a well motivated and studied candidate for dark matter in models with R-parity conservation. The small direct production cross sections of electroweakinos leads to difficult searches, despite relatively clean final states. This talk will highlight the most recent results of searches performed by the ATLAS experiment for charginos and neutralinos, covering a variety of model parameters and final states.
