Universal 10^{20} Hz stochastic gravitational waves from photon spheres of black holes

Monday, 23 August 2021 17:45 (15 minutes)

We show that photon spheres of supermassive black holes generate high-frequency stochastic gravitational waves through

the photon-graviton conversion.

Remarkably, the frequency is universally determined as $m_e \sqrt{m_e/m_p} \simeq 10^{20}$ Hz in terms of the proton mass m_p and the electron mass m_e .

It turns out that the density parameter of the stochastic gravitational waves Ω_{gw} could be 10^{-12} .

Since the existence of the gravitational waves from photon spheres is robust,

it is worth seeking methods of detecting high-frequency gravitational waves around $10^{20}\mathrm{Hz}.$
