

# GENERAL-BROKEN-LINES IN CORRYVRECKAN

---

**Lennart Huth**

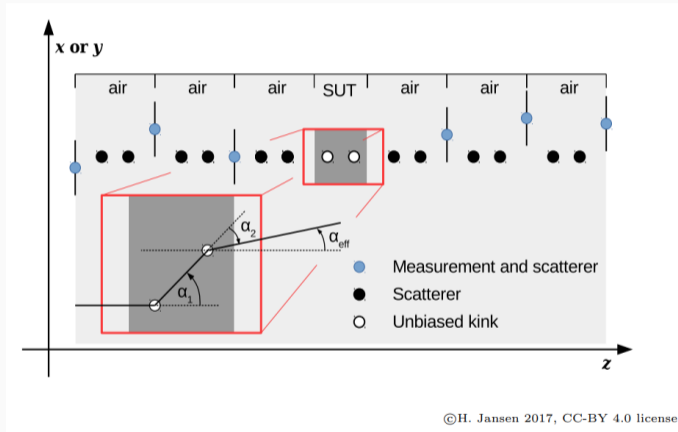

DESY

Jan 2020

# GBL IN A NUTSHELL

- Previous fit: straight line  $\rightarrow$  ignores scattering
- GBL combines uncertainties due to scattering and spatial resolution
- Assuming thin planes allows to ignore the displacement due to scattering
- Medium within planes can be approximated by two thin scattering layers
- GBL needs local residuals and scatters as input

# CORRYVREKAN IMPLEMENTATION I

- First cluster is used as seed
- Residuals are always defined in global plane at z-cluster
- Volume scatterers are placed at  $z_i + \Delta_{z_{i,i+1}} \left(0.5 \pm \sqrt{1/12}\right)$
- This ignores rotations

## CORRYVRECKAN IMPLEMENTATION II

- Spatial resolution in global coordinates depends on rotation  $\rightarrow$  ignored.

- Volume scatterers are placed at  $z_i + \Delta_{z_{i,i+1}} \left( 0.5 \pm \sqrt{1/12} \right)$
- Biased planes only a minor effect

# CORRYVREKAN IMPLEMENTATION III

- Spatial resolution in global coordinates depends on rotation  $\rightarrow$  ignored.
- DUT can cause issues for non-vanishing slopes and large rotations
- Cheap workaround: Set DUT as reference while aligning

# CONFIGURING THE TRACKING4D MODULE

- Only supported in Tracking4D
- Configuration parameters:
  - track\_model = "gbl"
  - volume\_scattering: Bool to enable volume scattering between the planes
  - volume\_scattering\_length: radiation length of the volume material
- Volume scattering causes the fit to fail in 0.1%-10% of the cases → under investigation

```
[Tracking4D]
momentum = 5.4GeV
track_model = "gbl"
spatial_cut_abs = 600um, 600um
time_cut_abs = 230us
min_hits_on_track = 7
exclude_dut = true
volume_scattering = true
volume_scattering_length = 304.2m
require_detectors = "Timepix3_0"
timestamp_from = "Timepix3_0"
```

# COMPARING THE RESOLUTION I

MIMOSA26\_4 Residual X

line: 7.7  $\mu\text{m}$

MIMOSA26\_4 Residual X

gbl: 3.7  $\mu\text{m}$

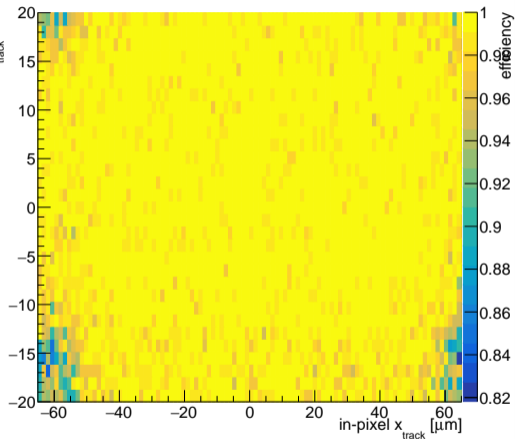

# COMPARING THE RESOLUTION II

ATLASPix\_0 Pixel efficiency map

line: 99.35%

ATLASPix\_0 Pixel efficiency map

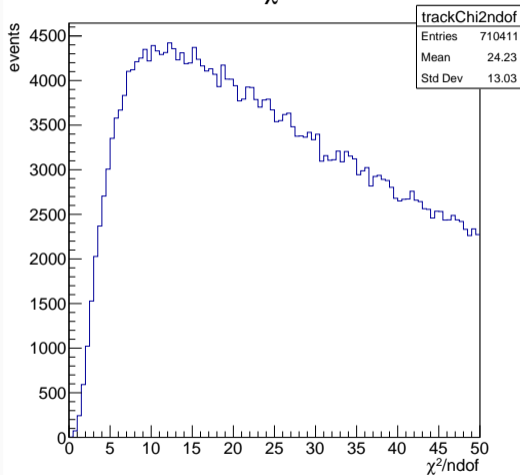

gbl: 99.30%

# COMPARING THE FIT

Track  $\chi^2/\text{ndof}$

Track  $\chi^2/\text{ndof}$

# OUTLOOK

- First version is ready
- Solving the issue with the failures with air scattering
- Check if the alignment based on GBL is working
- Update TrackingSpatial
- Taking all rotations into account → inspired by the proteus implementation
- Improving the seed by using a connection line between first and last hit
