

# *FTS & XRootD Workshop*

*Jozef Stefan Institute, Ljubljana, 27-31st March 2023*

# FTS

File Transfer Service

## *FTS3@CERN: Service Health Monitoring*

Mihai Patrascoiu  
on behalf of the FTS team

# Definition

- Monitoring meant for FTS Service operators
  - Helps us observe the state of the system
  - React preventively based on service health input
- Collected indirectly via logs / directly via probes or scripts
  - FluentBit parsing / Probes → Graphite ingestion → Grafana plots
- Code enhanced to print key moments in FTS execution (e.g.: time it takes to run a full scheduler cycle)
- Deployed for every FTS instance at CERN

# FluentBit collected metrics

- Code enhanced at key moments of FTS execution
- Desired values printed in <key>=<value> format
- FluentBit modus operandi:
  - Constantly tails the FTS log files  
(Transfer daemon, QoS daemon, Submission server)
  - Matches desired expression (regex filter)
  - Performs 1 minute aggregations (FTS events can be multiple per minute)
  - Sends no more than once per minute aggregations to ingestion source  
(Graphite storage)

# Probe collected metrics

- Probes custom written by us with specific purpose (e.g.: file state distribution in the database)
- Executed as cron jobs, never more often than once every minute
- Output sent to ingestion source (Graphite storage)
- Some probes also have alarms attached
  - When threshold hit, send SMS alarm + e-mail
  - Mark timestamp of last alarm
  - Configurable delay between alarms
- Probes ran by dedicated machine in FTS instance (fts-watchdog)
