MACHOs or PBHs as DM

DM can **NOT** be:

an astro *je ne sais pas quoi*:

- ~~gas~~

- ~~Black Holes~~

- ~~brown dwarves~~

a baryon of the SM:

DM can **NOT** be:

an astro *je ne sais pas quoi*:

- ~~gas~~

- ~~Black Holes~~

- ~~brown dwarves~~

a ~~baryon of the SM~~:

- BBN computes the abundance of He in terms of primordial baryons:
too much baryons => Universe full of Helium
- CMB says baryons are 4% max

DM can be:

an astro *je ne sais pas quoi*:

- ~~gas~~

- ~~Black Holes~~

- ~~brown dwarves~~

~~a baryon of the SM:~~

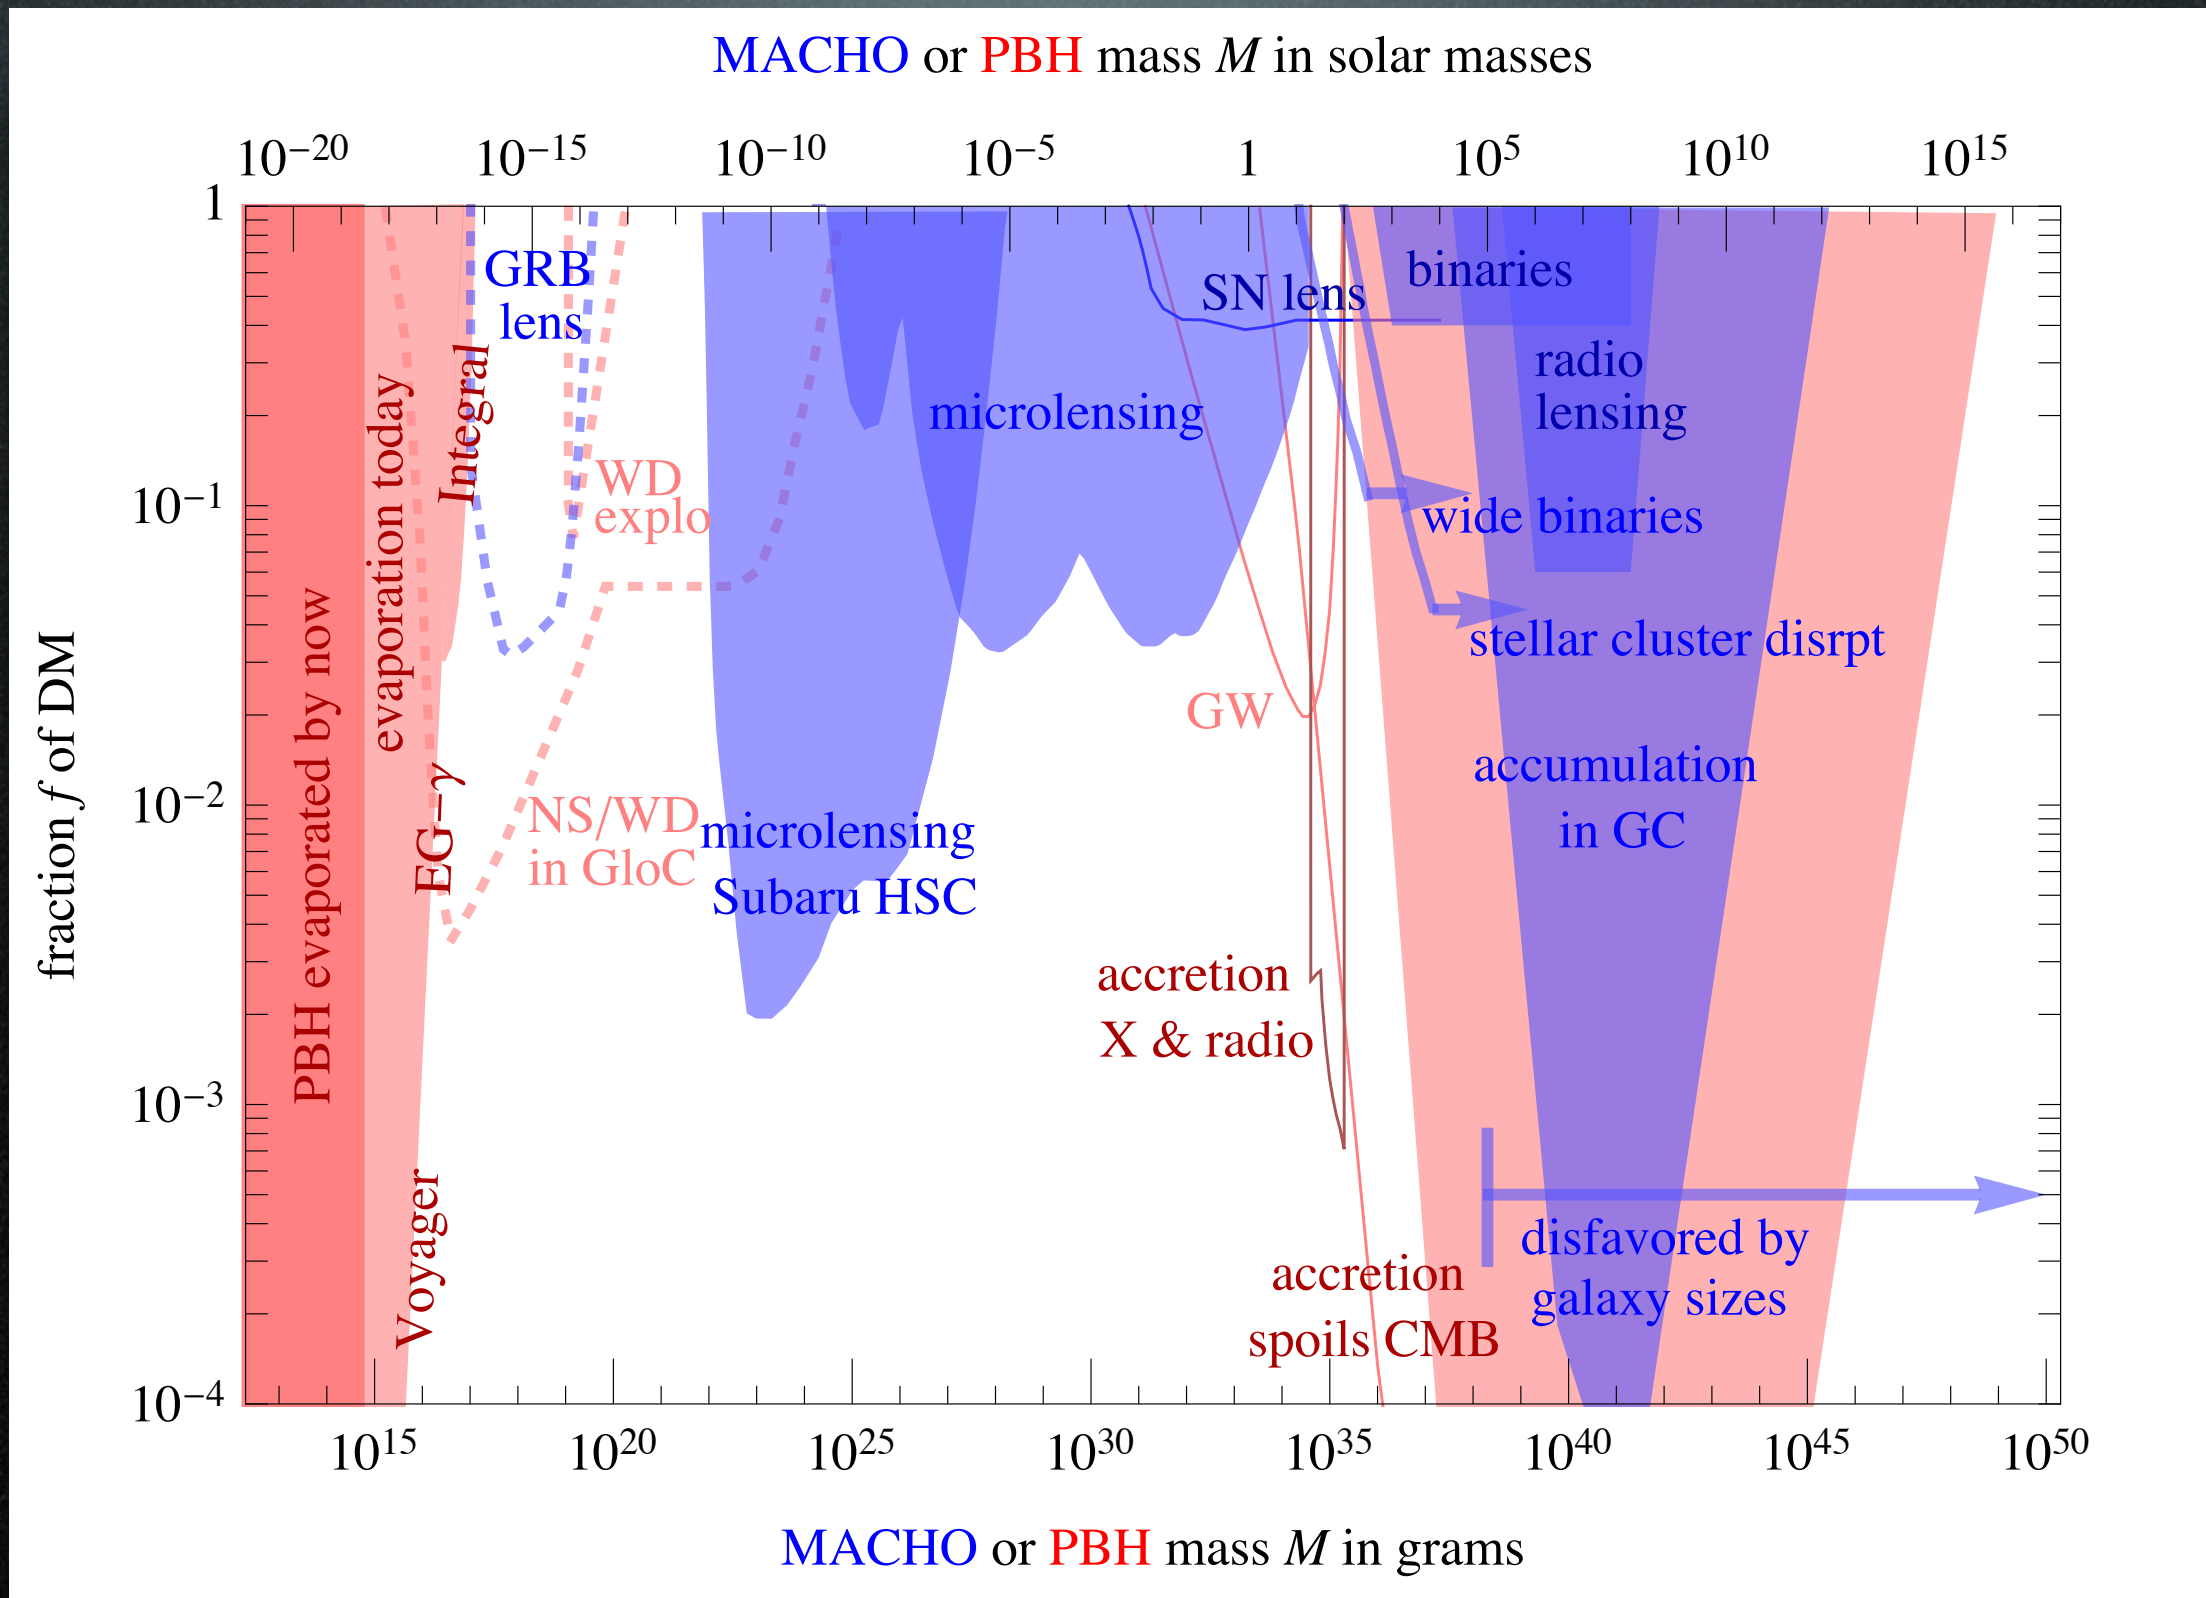

- BBN computes the abundance of He in terms of primordial baryons:
too much baryons => Universe full of Helium

- CMB says baryons are 4% max

A **loophole**: Primordial Black Holes!

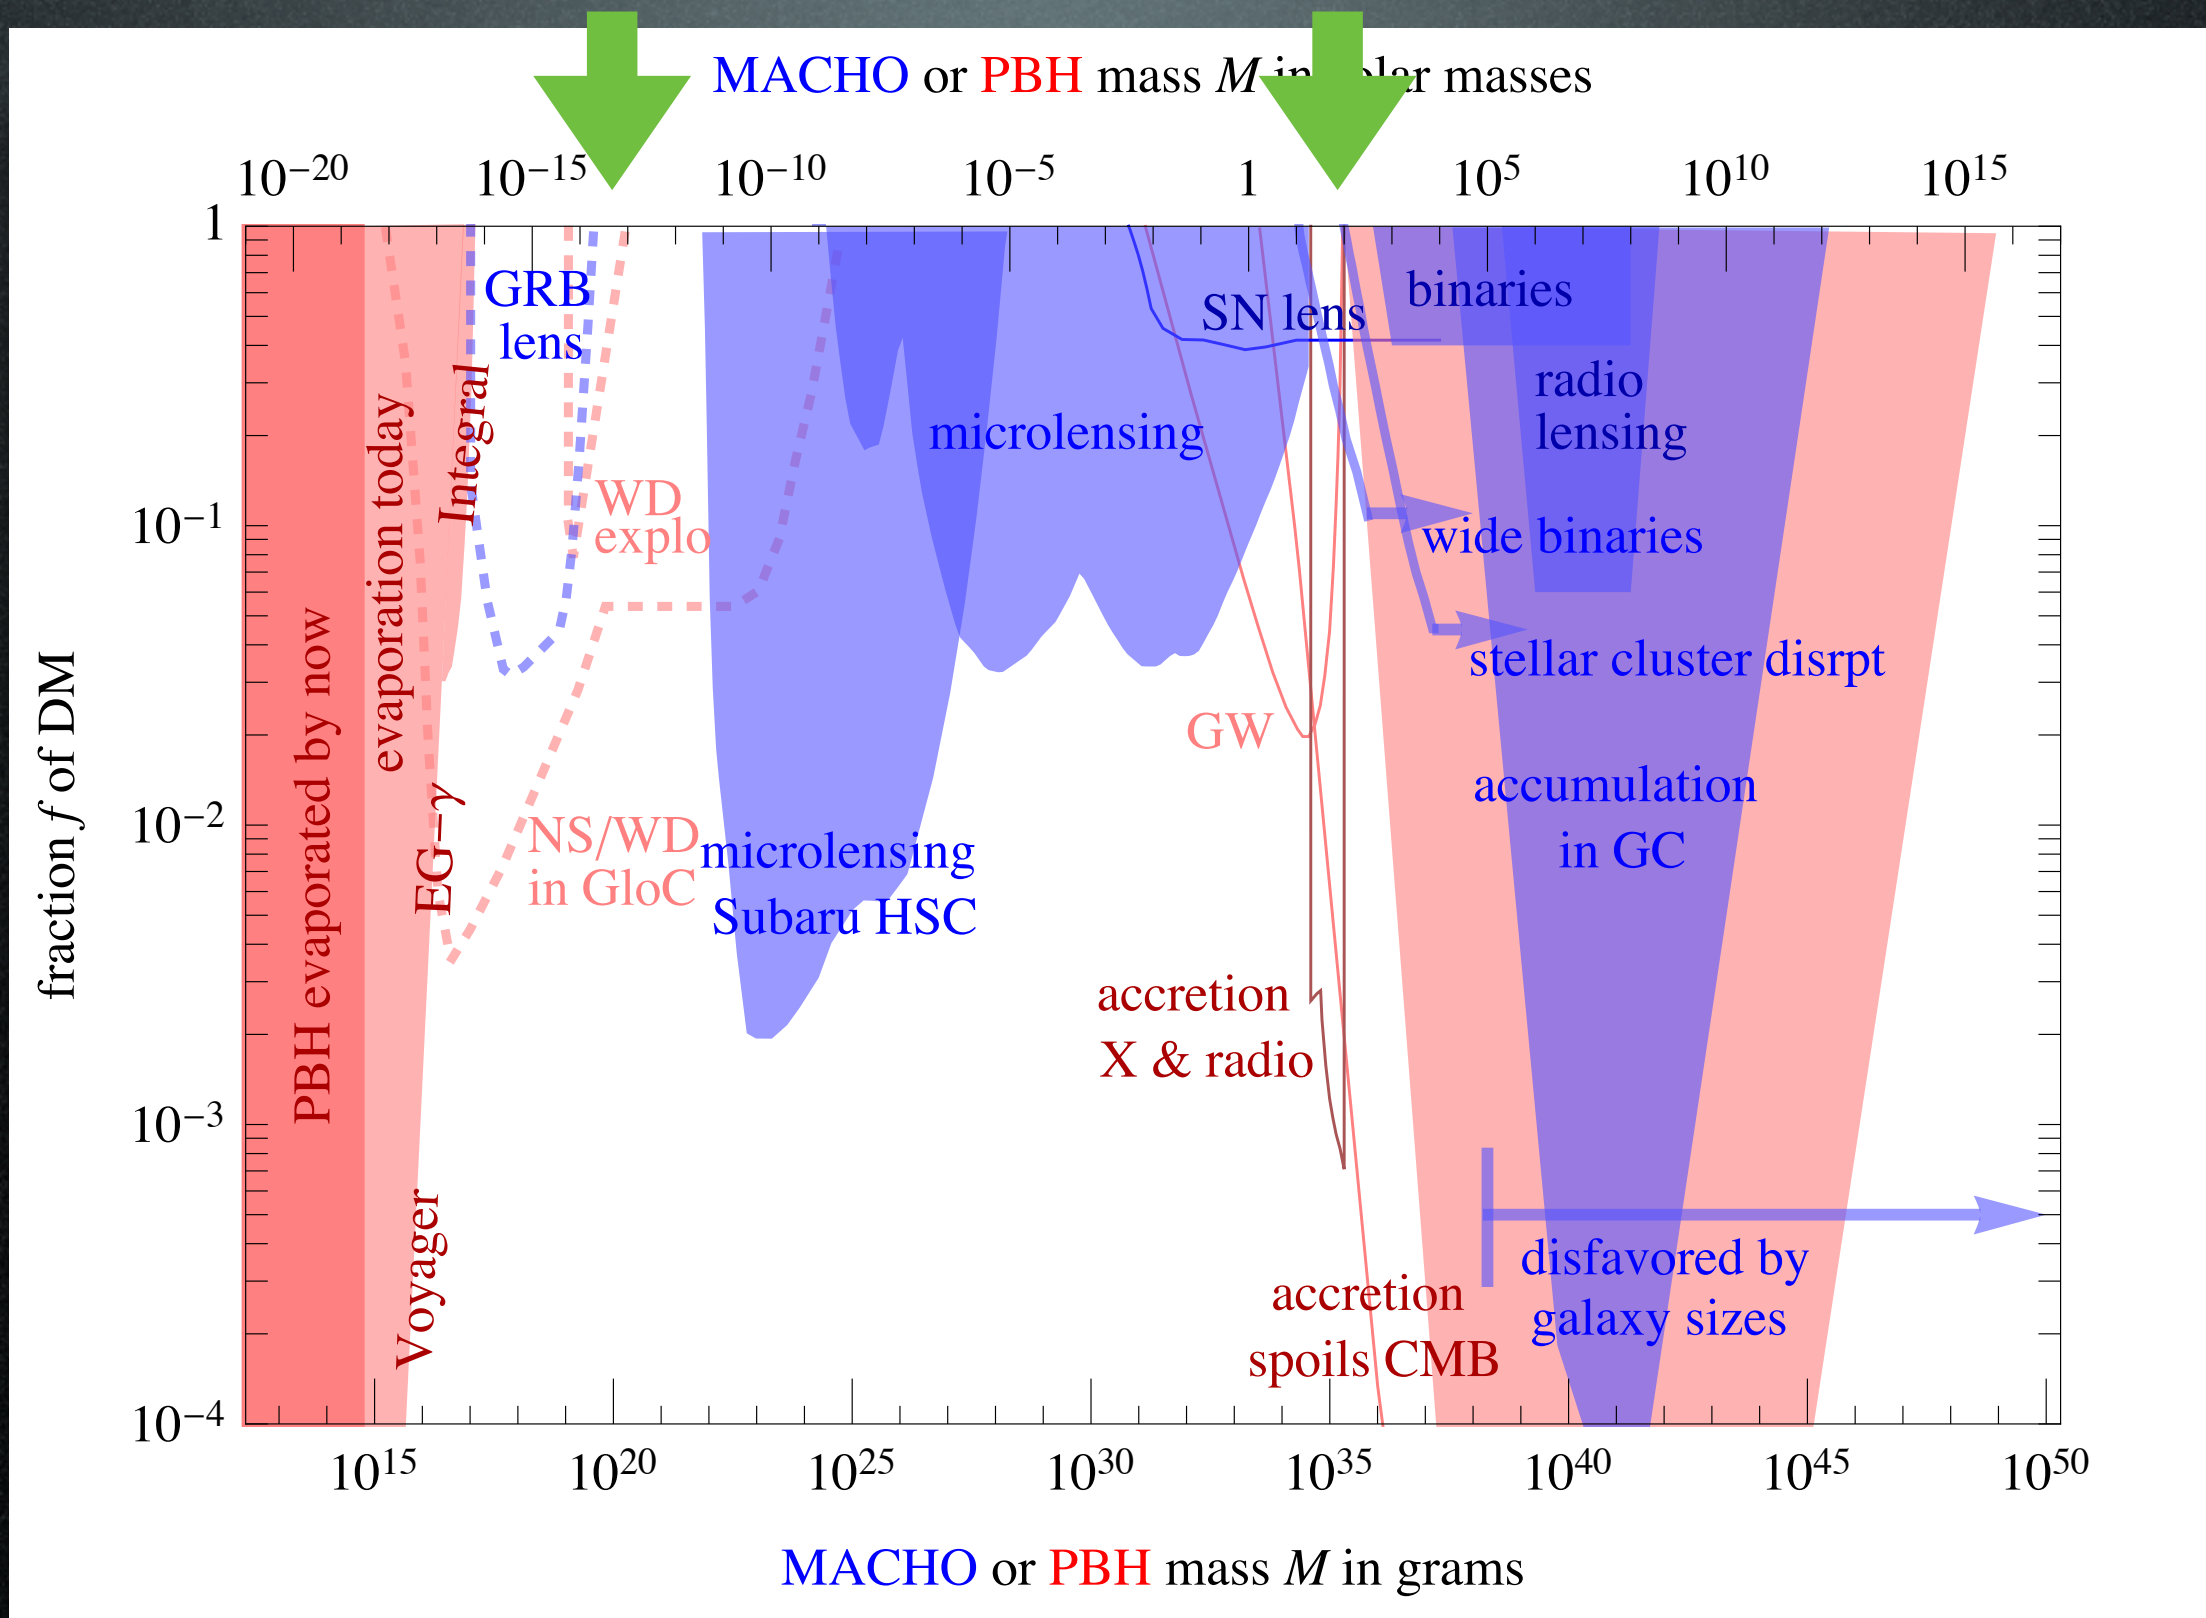

- produced before BBN
- with masses too small/large to lens
- perhaps LIGO/Virgo are seeing them?

PBHs as DM

PBHs as DM

transferring or co-genesis

via leptogenesis

DM stores the anti-B number

connection to neutrino masses

Freeze-in: like rodents in the paleocene

Hall, Jedamzik, March-Russell, West 2009

Consider a particle χ :

- subject to $f\bar{f} \rightarrow \chi, \chi\bar{\chi}$ with a very small rate
- 'heavy' (e.g. 100 GeV)
- 'stable'
- in an expanding Universe
- zero initial abundance

Freeze-in: like rodents in the paleocene

Hall, Jedamzik, March-Russell, West 2009

Consider a particle χ :

- subject to $f\bar{f} \rightarrow \chi, \chi\bar{\chi}$ with a very small rate
- 'heavy' (e.g. 100 GeV)
- 'stable'
- in an expanding Universe
- **zero initial abundance**

Freeze-in: like rodents in the paleocene

Hall, Jedamzik, March-Russell, West 2009

Consider a particle χ :

Each multiplet contains a neutral component with a proper assignment of the hypercharge, according to

$$Q = T_3 + Y \equiv 0$$

e.g. for $n = 2$: $T_3 = \begin{pmatrix} +\frac{1}{2} \\ -\frac{1}{2} \end{pmatrix} \Rightarrow |Y| = \frac{1}{2}$

e.g. for $n = 3$: $T_3 = \begin{pmatrix} +1 \\ 0 \\ -1 \end{pmatrix} \Rightarrow |Y| = 0 \text{ or } 1$

etc.

The ideal DM candidate is

weakly int., massive, neutral, stable

No allowed decay!
Automatically stable!

Decaying DM

DM need not be absolutely stable,
just $\tau_{\text{DM}} \gtrsim \tau_{\text{universe}} \simeq 4.3 \cdot 10^{17} \text{sec}$.

The current CR anomalies can be due to decay with:

$$\tau_{\text{decay}} \approx 10^{26} \text{sec}$$

Motivations from theory?

- dim 6 suppressed operator in GUT Arvanitaki, Dimopoulos et al., 2008+09

$$\tau_{\text{DM}} \simeq 3 \cdot 10^{27} \text{sec} \left(\frac{1 \text{ TeV}}{M_{\text{DM}}} \right)^5 \left(\frac{M_{\text{GUT}}}{2 \cdot 10^{16} \text{ GeV}} \right)^4$$

- or in TechniColor

Nardi, Sannino, Strumia 2008

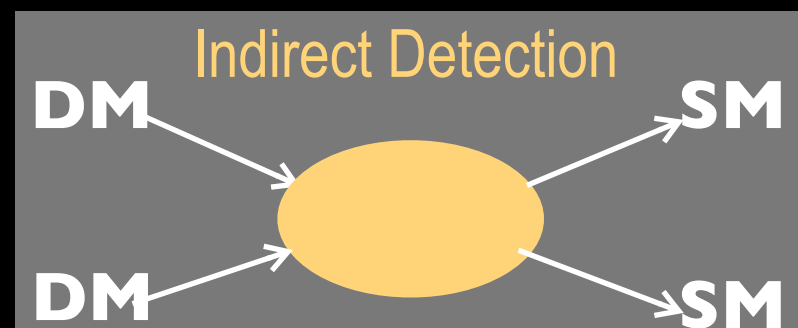

- gravitino in SuSy with broken R-parity...

Stability

Executive summary

- DM exists
- it's a **new, unknown particle**
 - no SM particle can fulfil*
 - dilutes as $1/a^3$ with universe expansion*
- makes up **26%** of total energy
84% of total matter
 - $\Omega_{\text{DM}} h^2 = 0.1188 \pm 0.0010$
(notice error!)
- neutral particle *'dark'...*
- cold** or not too warm
 - $p/m \ll 1$ at CMB formation*
- very **feebly** interacting
 - with itself*
 - with ordinary matter ('collisionless')*
- stable** or very long lived
 - $\tau_{\text{DM}} \gg 10^{17} \text{sec}$
- possibly a relic from the EU
- searched for by

Asymmetric Dark Matter

Nussinov 1985

D.B.Kaplan 1992

Farrar, Zaharijas 2005

Zurek 2009

+ many many >2009

A completely different relic from the Early Universe

Provided:

- an initial asymmetry
- strong enough annihilations

$$\Omega_{\mathbf{x}} \simeq \frac{m_{\mathbf{x}} s}{\rho_{\text{crit}}} \eta_0$$

The relic abundance is determined by η_0 and $m_{\mathbf{x}}$.

miracle

The region at large m_{DM} and larg-ish σ_0 is open for business.

‘Secluded’ Dark Matter

Pospelov, Ritz, Voloshin 2007

Arkani-Hamed, Finkbeiner, Slatyer, Weiner 2008

+ many many many >2009

Main motivation

positron fraction

antiprotons

electrons + positrons

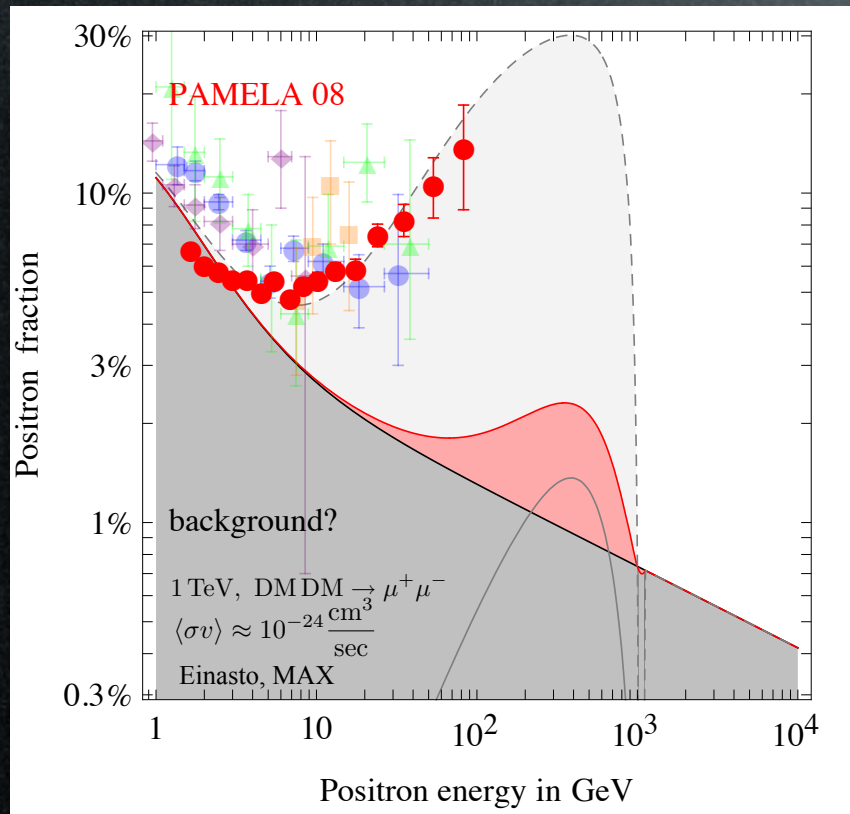

Are these signals of Dark Matter?

YES: few TeV, leptophilic DM
with huge $\langle \sigma v \rangle \approx 10^{-23} \text{ cm}^3/\text{sec}$

Main motivation

positron fraction

antiprotons

electrons + positrons

Are these signals of Dark Matter?

YES: few TeV, leptophilic DM
with huge $\langle \sigma v \rangle \approx 10^{-23} \text{ cm}^3 / \text{sec}$

NO: a formidable 'background' for future searches

The “Theory of DM”

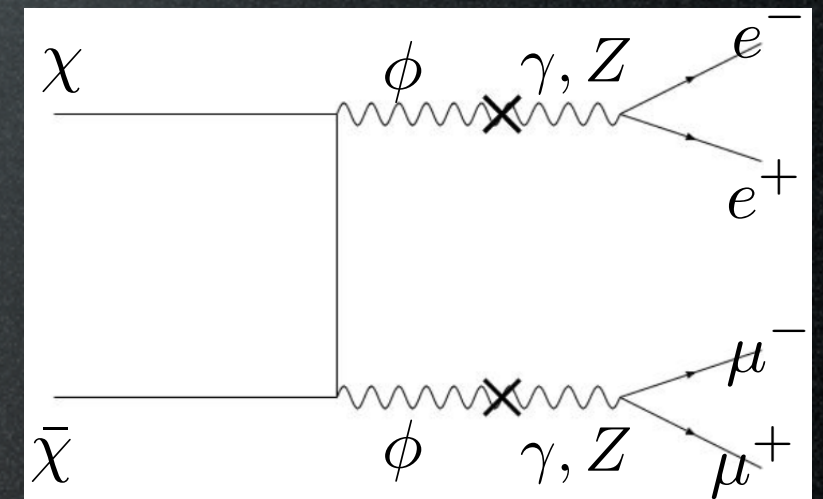

Arkani-Hamed, Weiner, Finkbeiner et al. 0810.0713
0811.3641

Basic ingredients:

- χ Dark Matter particle, decoupled from SM, mass $M \sim 700+$ GeV
- ϕ new gauge boson (“Dark photon”),
couples only to DM, with typical gauge strength, $m_\phi \sim$ few GeV
- mediates Sommerfeld enhancement of $\chi\bar{\chi}$ annihilation:

$$\alpha M/m_V \gtrsim 1 \quad \text{fulfilled}$$

- decays only into e^+e^- or $\mu^+\mu^-$
for kinematical limit

The “Theory of DM”

Arkani-Hamed, Weiner, Finkbeiner et al. 0810.0713
0811.3641

Basic ingredients:

- χ Dark Matter particle, decoupled from SM, mass $M \sim 700+ \text{ GeV}$
- ϕ new gauge boson (“Dark photon”),
couples only to DM, with typical gauge strength, $m_\phi \sim \text{few GeV}$
- mediates Sommerfeld enhancement of $\chi\bar{\chi}$ annihilation:

$$\alpha M/m_V \gtrsim 1 \quad \text{fulfilled}$$

- decays only into e^+e^- or $\mu^+\mu^-$
for kinematical limit

Production mechanism:

just **thermal freeze-out**
of these annihilations

same idea in: WIMPless DM [Feng, Kumar 2008](#)

The “Theory of DM”

Arkani-Hamed, Weiner, Finkbeiner et al. 0810.0713
0811.3641

Basic ingredients:

- χ Dark Matter particle, decoupled from SM, mass $M \sim 700+$ GeV
- ϕ new gauge boson (“Dark photon”),
couples only to DM, with typical gauge strength, $m_\phi \sim$ few GeV
- mediates Sommerfeld enhancement of $\chi\bar{\chi}$ annihilation:

$$\alpha M/m_V \gtrsim 1 \quad \text{fulfilled}$$

- decays only into e^+e^- or $\mu^+\mu^-$
for kinematical limit

Extras:

- χ is a multiplet of states and ϕ is non-abelian gauge boson:
splitting $\delta M \sim 200$ KeV (via loops of non-abelian bosons)
- inelastic scattering explains DAMA
- excited state decay $\chi\chi \rightarrow \chi\chi^* \hookrightarrow e^+e^-$ explains INTEGRAL

Variations

(selected)

- ★ pioneering: Secluded DM, U(1) Stückelberg extension of SM

Pospelov, Ritz et al 0711.4866 P.Nath et al 0810.5762

- ★ Axion Portal: ϕ is pseudoscalar axion-like

Nomura, Thaler 0810.5397

- ★ singlet-extended UED: χ is KK RNnu, ϕ is an extra bulk singlet

Bai, Han 0811.0387

- ★ split UED: χ annihilates only to leptons because quarks are on another brane

Park, Shu 0901.0720

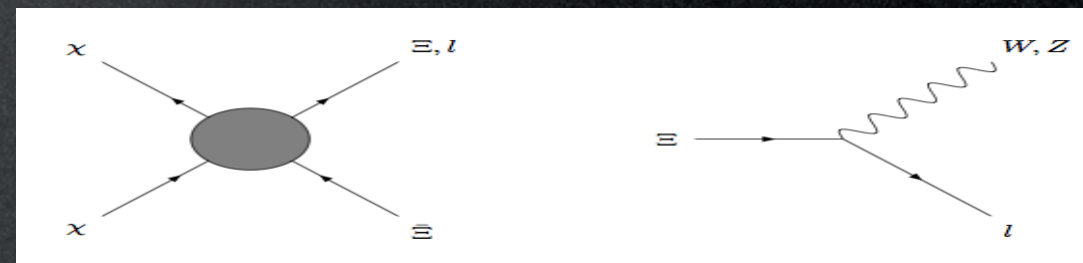

- ★ DM carrying lepton number: χ charged under $U(1)_{L_\mu - L_\tau}$, ϕ gauge boson ($m_\phi \sim$ tens GeV)

Cirelli, Kadastik, Raidal, Strumia 0809.2409

Fox, Poppitz 0811.0399

- ★ New Heavy Lepton: χ annihilates into Ξ that carries lepton number and decays weakly (\sim TeV) (\sim 100s GeV)

Phalen, Pierce, Weiner 0901.3165

- ★
