Mexico City

A. Ortiz and L. Serkin

---

**A. Ortiz&G.P A look into the “hedgehog”  
events in pp collisions using a new event shape  
- flatenicity**

- The highest multiplicities do not yield the maximum leading- $p_T$  reach

# THE FORGOTTEN FEATURES

ALICE data Figure from B. Hess PhD thesis:  
<https://cds.cern.ch/record/2058633/>

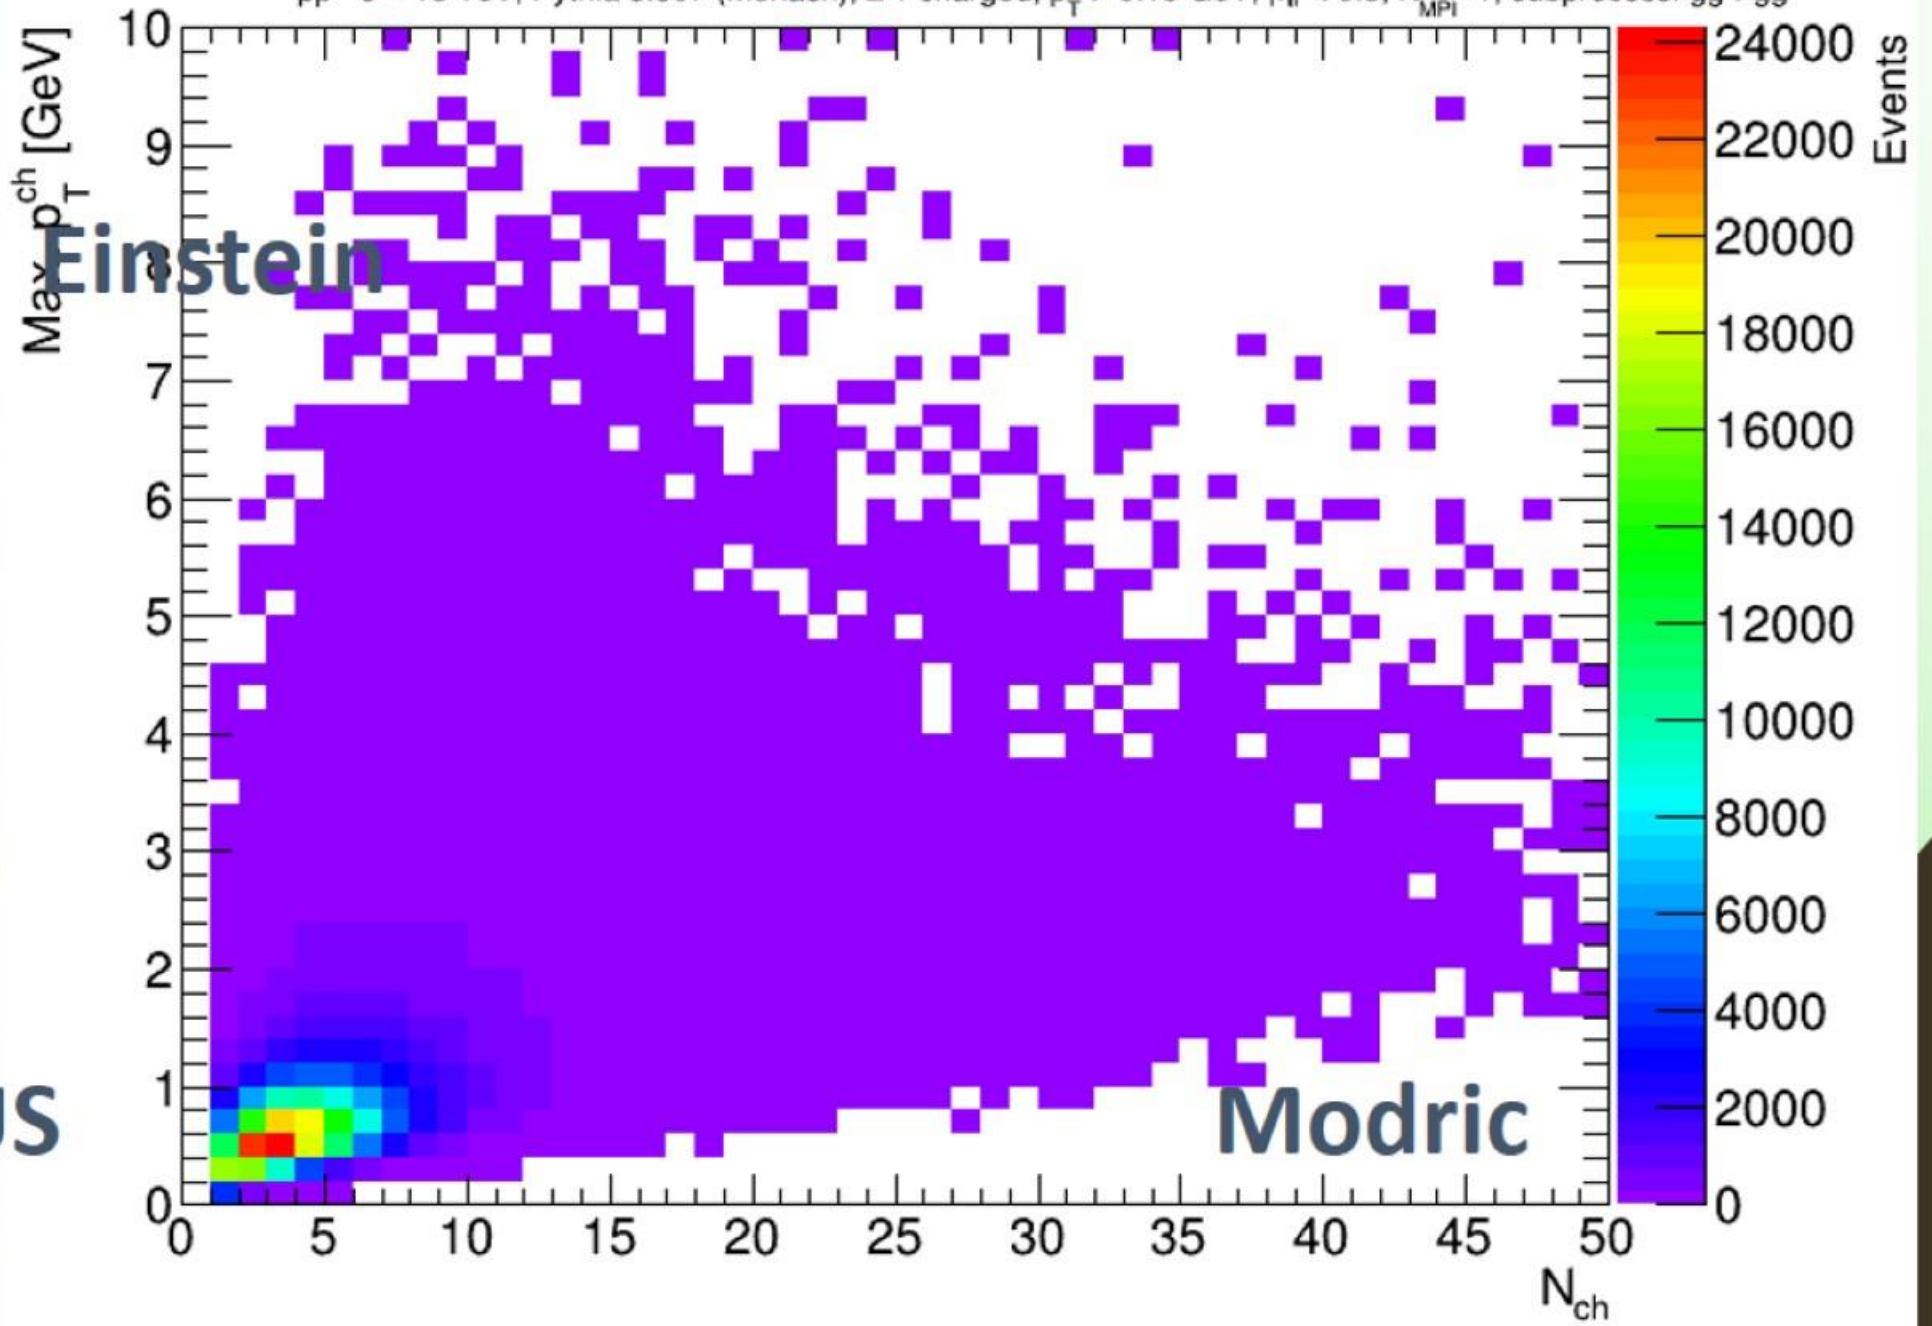

# Are the "means" the end of the story?

Much of the results on quark gluon plasma rely on "means" the distributions around it are not studied with the exception of some analyses in the frame work of event structure variables.

In the normal life we are interested exclusively by "outliers" champions, scientists, events on the world scene - that are outside the means...

---

pp  $s = 13$  TeV, Pythia 8.307 (Monash),  $\geq 1$  charged,  $p_T > 0.15$  GeV,  $|\eta| < 0.8$ ,  $N_{MPI} = 1$ , subprocess: gg->gg

# Strong increase in the high- $p_T$ yields with multiplicity

But observed increase at low momenta – small but real

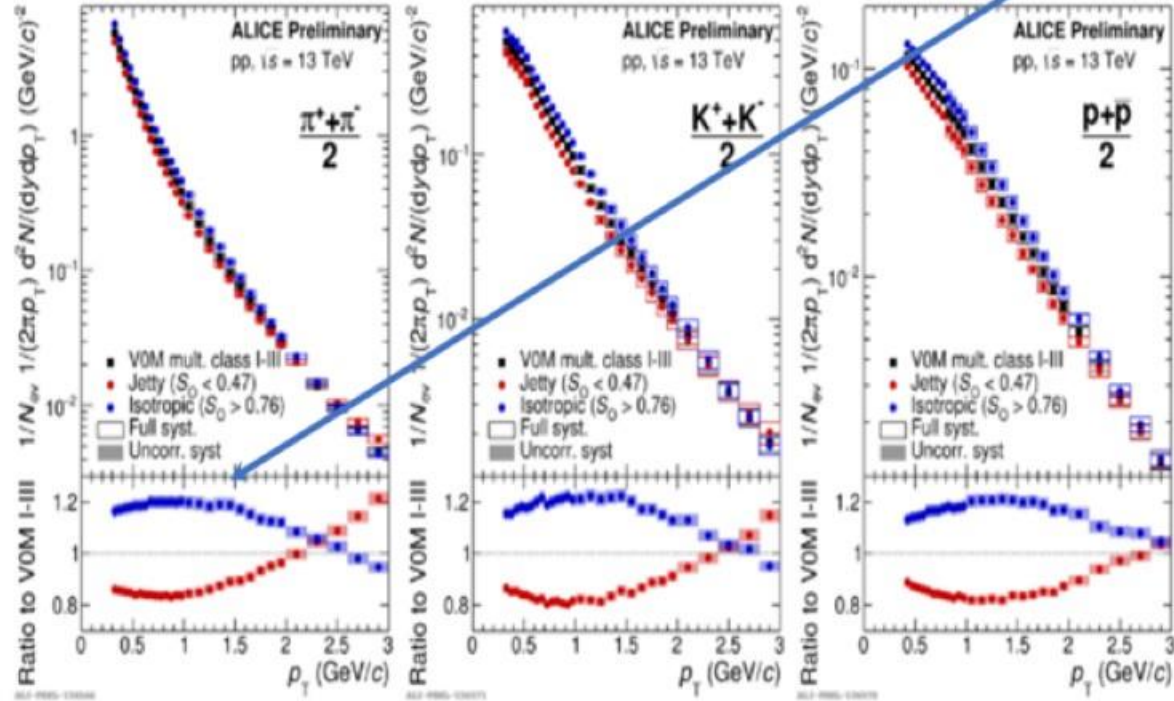

Fig. 2. Top panels: transverse momentum spectra of  $\pi^+$ ,  $K^+$ , and  $p(\bar{p})$  in VOM multiplicity class I-III events, jetty events (20% lowest  $S_0$ ) and isotropic events (20% highest  $S_0$ ). Bottom panels: ratio of spectra in jetty (isotropic) events to the VOM class I-III.

In heavy ion energy loss is well established but this is for the time the only signature that was not observed in pp collisions

But, if I can have question: if I have a quenched jet should I allow for the possibility to see both primary jets absorbed?

In that sense let's go back to **prehistory!**

# CDF

Chris Quigg: arXiv:1004.0975v1 [hep-ph]

An interesting example—an **atypical** event observed in  $\bar{p}p$  interactions at  $\sqrt{s} = 1.8$  TeV by CDF's Run 1 detector, is shown in Figure 3.<sup>(3)</sup> This event was accepted by a  $\sum E_{\perp}$  trigger, without any topological requirement. The LEGO<sup>®</sup> plot shows many bursts of energy: More than a hundred active towers pass the display threshold of 0.5 GeV. The total transverse energy in the event is 321 GeV, but it is not concentrated in a few sprays, it is everywhere. The central tracking chamber records about sixty charged particles.

I am assured that this **"hedgehog"** event is authentic: it is not merely coherent noise in the counters. The colleague who selected this specimen estimated similar events to be about as common in the online event stream as  $Z^0$  production and decay into lepton pairs: about one in ten thousand triggers. I include this **outlier** as a reminder that when we think about the strong interactions outside the realm of a single hard scattering, we should think not only about the large diffractive and "multiperipheral" cross sections, but also about less common phenomena.

# UA1

Albajar, C., et al. (UA1 Collaboration). Analysis of the Highest Transverse Energy Events Seen in the UA1 Detector at the SppS Collider. Z. Phys. C36 (1987),

**• Conclusion: there are "rare" events in pp collisions that have never been seriously studied**

# Rare events seen also in Generators!

PYTHIA 8.303 (Monash 2013), pp  $\sqrt{s} = 13$  TeV,  $N_{\text{mpi}}=29$ ,  $N_{\text{ch}}=422$

# Absence of high pts

PYTHIA 8.303 (Monash 2013), pp  $\sqrt{s} = 13$  TeV,  $N_{\text{mpi}}=4$ ,  $N_{\text{ch}}=414$

Typical pp event: jets + UE, high particle density at mid-pseudorapidity

**Same multiplicity – completely different distributions!**

PYTHIA 8.303 (Monash 2013), pp  $\sqrt{s} = 13$  TeV,  $N_{\text{mpi}}=24$ ,  $N_{\text{ch}}=428$

NMPI=24

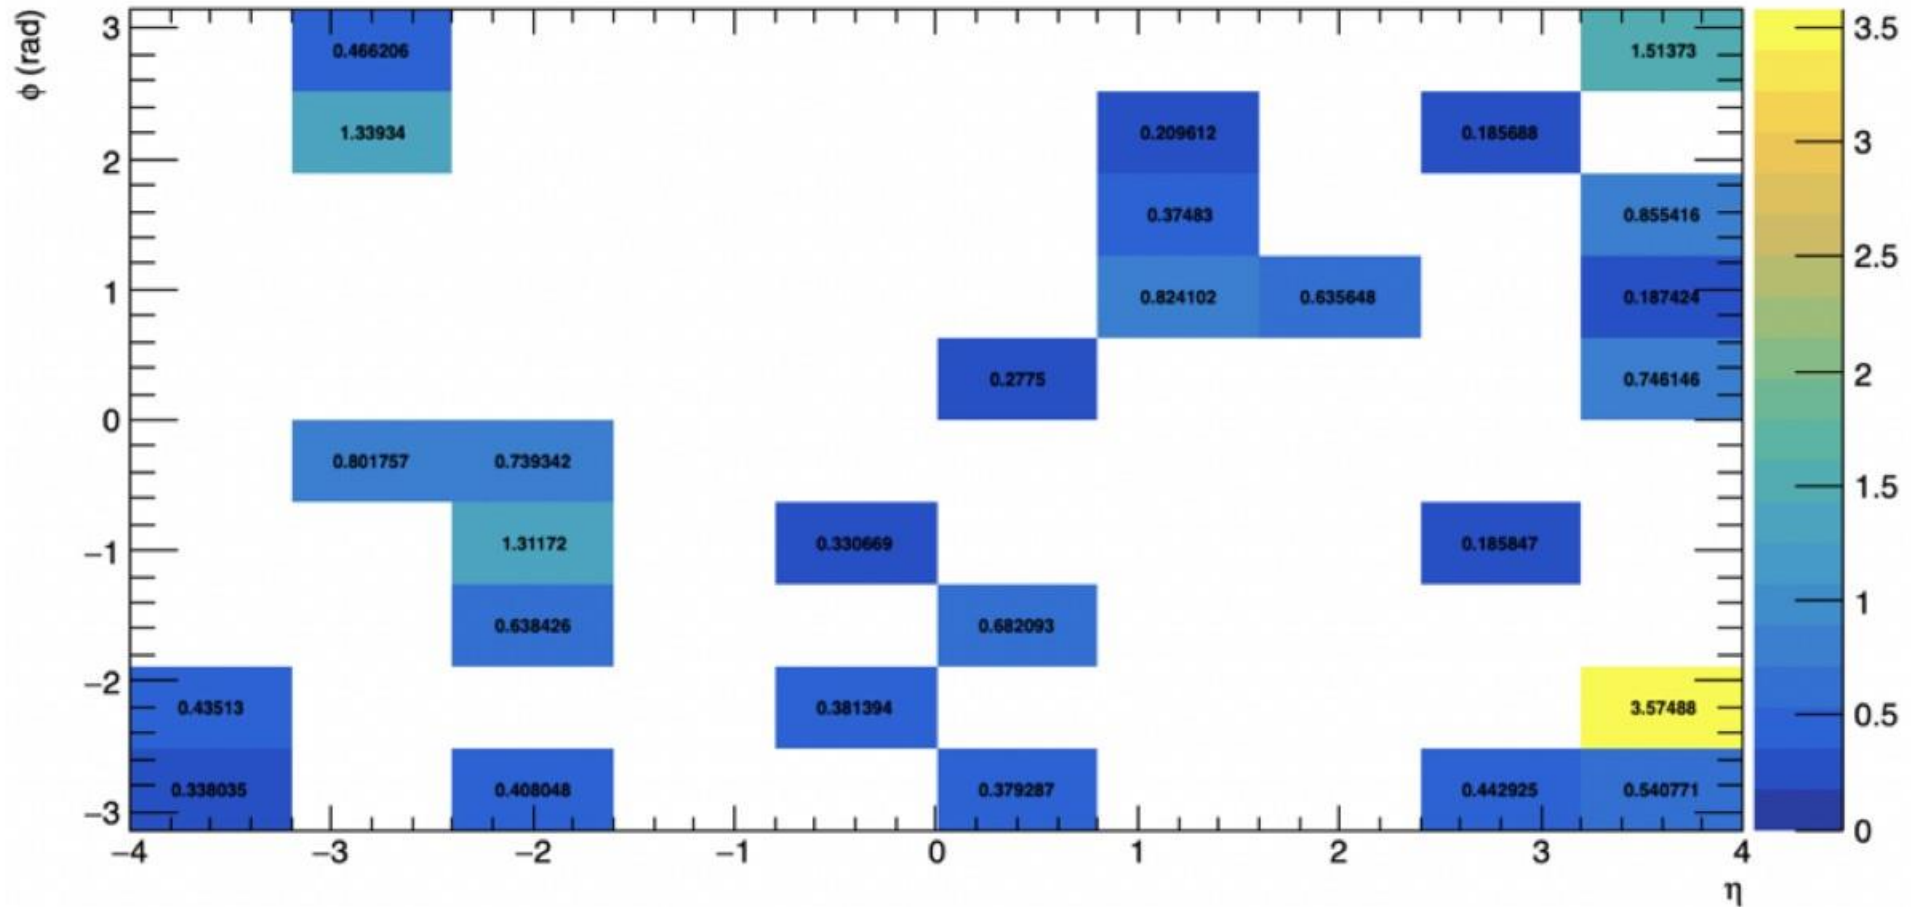

Several "soft" partonic scatterings

**How to trigger on such events?**

---

YES!

A grid in eta-phi is built (10x10)

The average  $p_T$  is determined in each cell ( $0.15 < p_T < 20$  GeV/c):  $\langle p_T \rangle = \sum \langle p_T \rangle^{\text{cell}} / 100$

The relative sigma is determined as follows:  $\rho = \sigma_{\langle p_T \rangle} / \langle p_T \rangle$

# The difference between known evento structure parameters and rho

- **It is more detailed than the sphericicy/spherocity/RT parameters**

**By selecting the events using the two parameters: sigma and rho One can perfectly well observe the evolution of the events from a jetty form to the hedgehog type**

---

Many low energy jets that look originating from initial jets?!

# FastJet, anti-kt, R=0.4, min jet pT of 5 GeV

pp@13 TeV, Pythia 8.307 (Monash),  $p_T^{\text{ch}} > 0.15$  GeV,  $p_T^{\text{jet}} > 5$  GeV

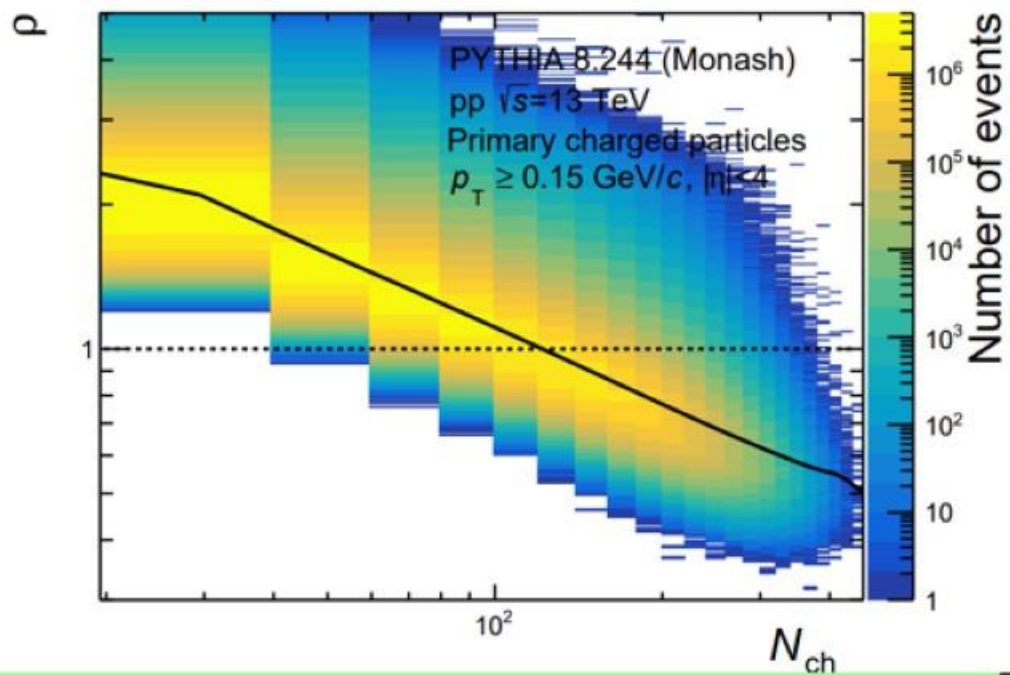

$N_{\text{MPI}} = 9$ ,  $N_{\text{ch}} = 348$ ,  $N_{\text{jets}} = 8$

pp@13 TeV, Pythia 8.307 (Monash),  $p_T^{\text{ch}} > 0.15 \text{ GeV}$ ,  $p_T^{\text{jet}} > 5 \text{ GeV}$

$N_{\text{MPI}} = 3$ ,  $N_{\text{ch}} = 349$ ,  $N_{\text{jets}} = 8$ ,  $\rho = 0.53$

# Dial your favorite event!

- By choosing the trigger we can identify very rare events for study

High  $\langle p_T \rangle$  fluctuations

PYTHIA 8.303 (Monash 2013), pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 300$ ,  $\rho / \langle \rho \rangle > 1.15$ ,  $\langle p_T^{trig} \rangle = 9$  GeV/c

Low  $\langle p_T \rangle$  fluctuations

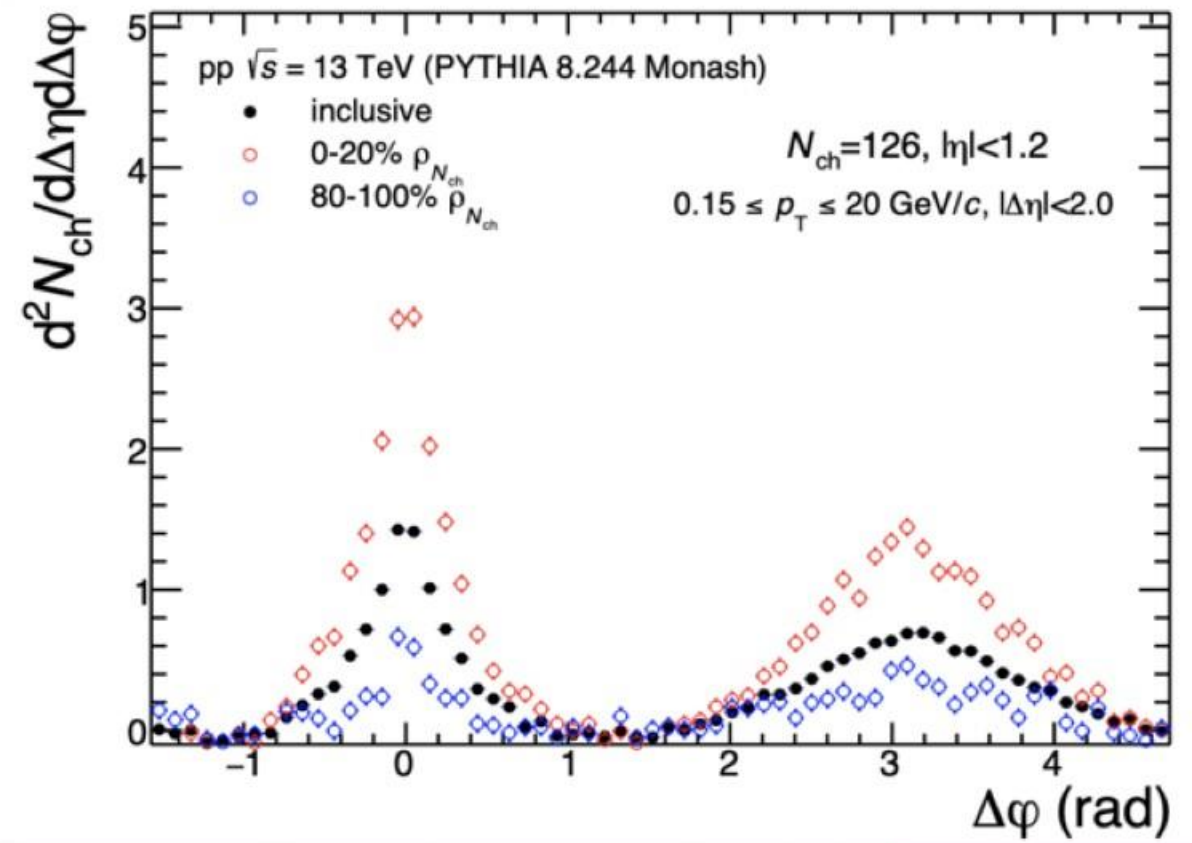

PYTHIA 8.303 (Monash 2013), pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 300$ ,  $\rho / \langle \rho \rangle < 0.85$ ,  $\langle p_T^{trig} \rangle = 4$  GeV/c

$0.15 < p_T < 20$  GeV/c

High multiplicity pp collisions

# Hedgehog events can be tagged even at low multiplicities!

# Di-hadron correlations (jetty): several MC generators

Pythia Monash, pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 100$ ,  $\rho(\rho) > 1.15$ ,  $\langle p_T^{sig} \rangle = 6$  GeV/c

Pythia Monash noCR, pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 100$ ,  $\rho(\rho) > 1.15$ ,  $\langle p_T^{sig} \rangle = 6$  GeV/c

Pythia Monash ropes, pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 100$ ,  $\rho(\rho) > 1.15$ ,  $\langle p_T^{sig} \rangle = 7$  GeV/c

Epos LHC, pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 100$ ,  $\rho(\rho) > 1.15$ ,  $\langle p_T^{sig} \rangle = 6$  GeV/c

AMPT, pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 100$ ,  $\rho(\rho) > 1.15$ ,  $\langle p_T^{sig} \rangle = 7$  GeV/c

Leading jet peak is model dependent, in particular EPOS LHC gives a "suppression effect"

High multiplicity  $N_{ch} \geq 100$  ( $|\eta| < 4$ ), jet-like structure  $\rho(\rho) > 1.15$

# Di-hadron correlations (hedgehog): several MC generators low

Pythia Monash, pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 100$ ,  $\rho/\langle\rho\rangle < 0.85$ ,  $\langle p_T^{m\eta} \rangle = 3$  GeV/c

Pythia Monash noCR, pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 100$ ,  $\rho/\langle\rho\rangle < 0.85$ ,  $\langle p_T^{m\eta} \rangle = 2$  GeV/c

Pythia Monash ropes, pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 100$ ,  $\rho/\langle\rho\rangle < 0.85$ ,  $\langle p_T^{m\eta} \rangle = 3$  GeV/c

Epos LHC, pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 100$ ,  $\rho/\langle\rho\rangle < 0.85$ ,  $\langle p_T^{m\eta} \rangle = 3$  GeV/c

AMPT, pp  $\sqrt{s} = 13$  TeV  
 $|\eta| < 4$ ,  $0.15 \leq p_T < 20$  GeV/c,  $N_{ch} > 100$ ,  $\rho/\langle\rho\rangle < 0.85$ ,  $\langle p_T^{m\eta} \rangle = 3$  GeV/c

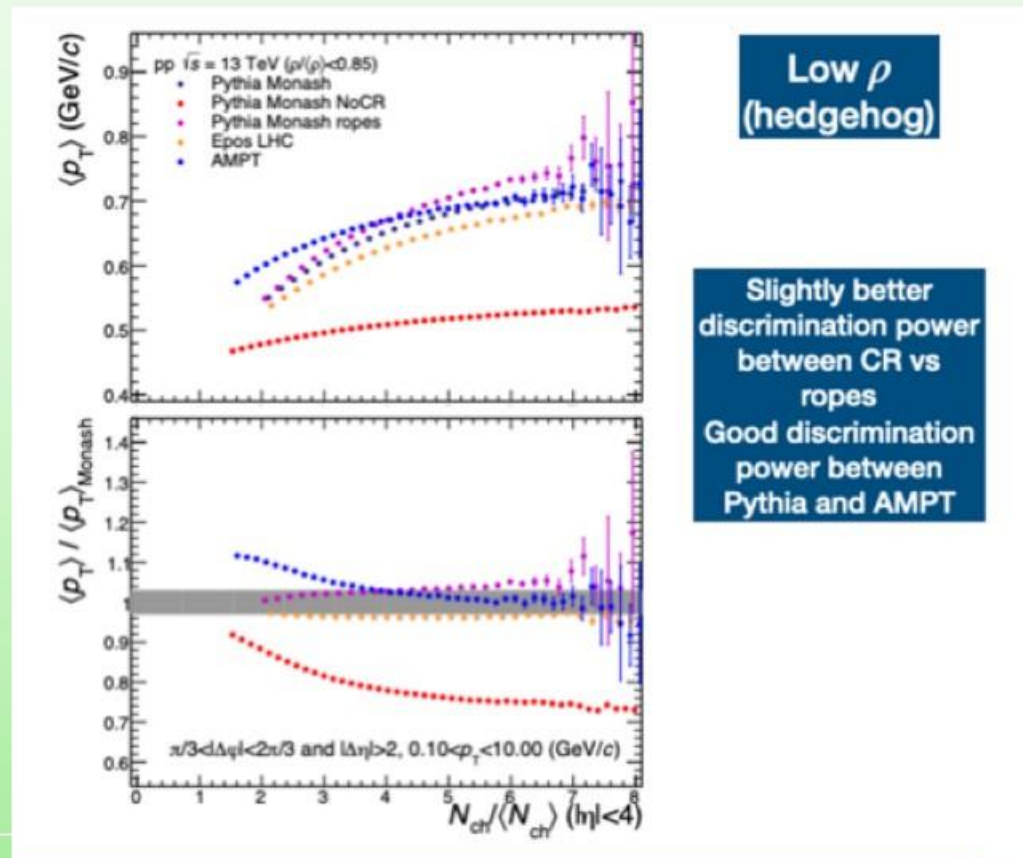

We can find hedgehogs like events in all event generators

High multiplicity  $N_{ch} \geq 100$  ( $|\eta| < 4$ ), isotropic distribution of  $p_T$  ( $\rho/\langle\rho\rangle < 0.85$ )

# All MC generators predict the existence of hedgehog events!!!

- The details of the predictions varies from one generator to another so that experimental comparison with MCs offers the possibility to tune the generators

# Summary

- **We define a new event structure - flattenicity- to isolate hedgehog events.**
  - **The quantity rho, which measures how isotropic the event is, has been defined and tested using different MC generators**
  - **MC generators predict different features of hedgehog-like events (di-hadron correlations and average pT)**
  - **We propose to measure di-hadron correlations, and average transverse momentum, for hedgehog and jetty like events.**
  - **The hedgehog events may shed light to the long search for “energy loss” like effects in pp and open a new way to study pp collisions**
-

Stay tuned as we  
analyze the data!

---
