

JobAgent/JobWrapper function

The JAliEn job pilot

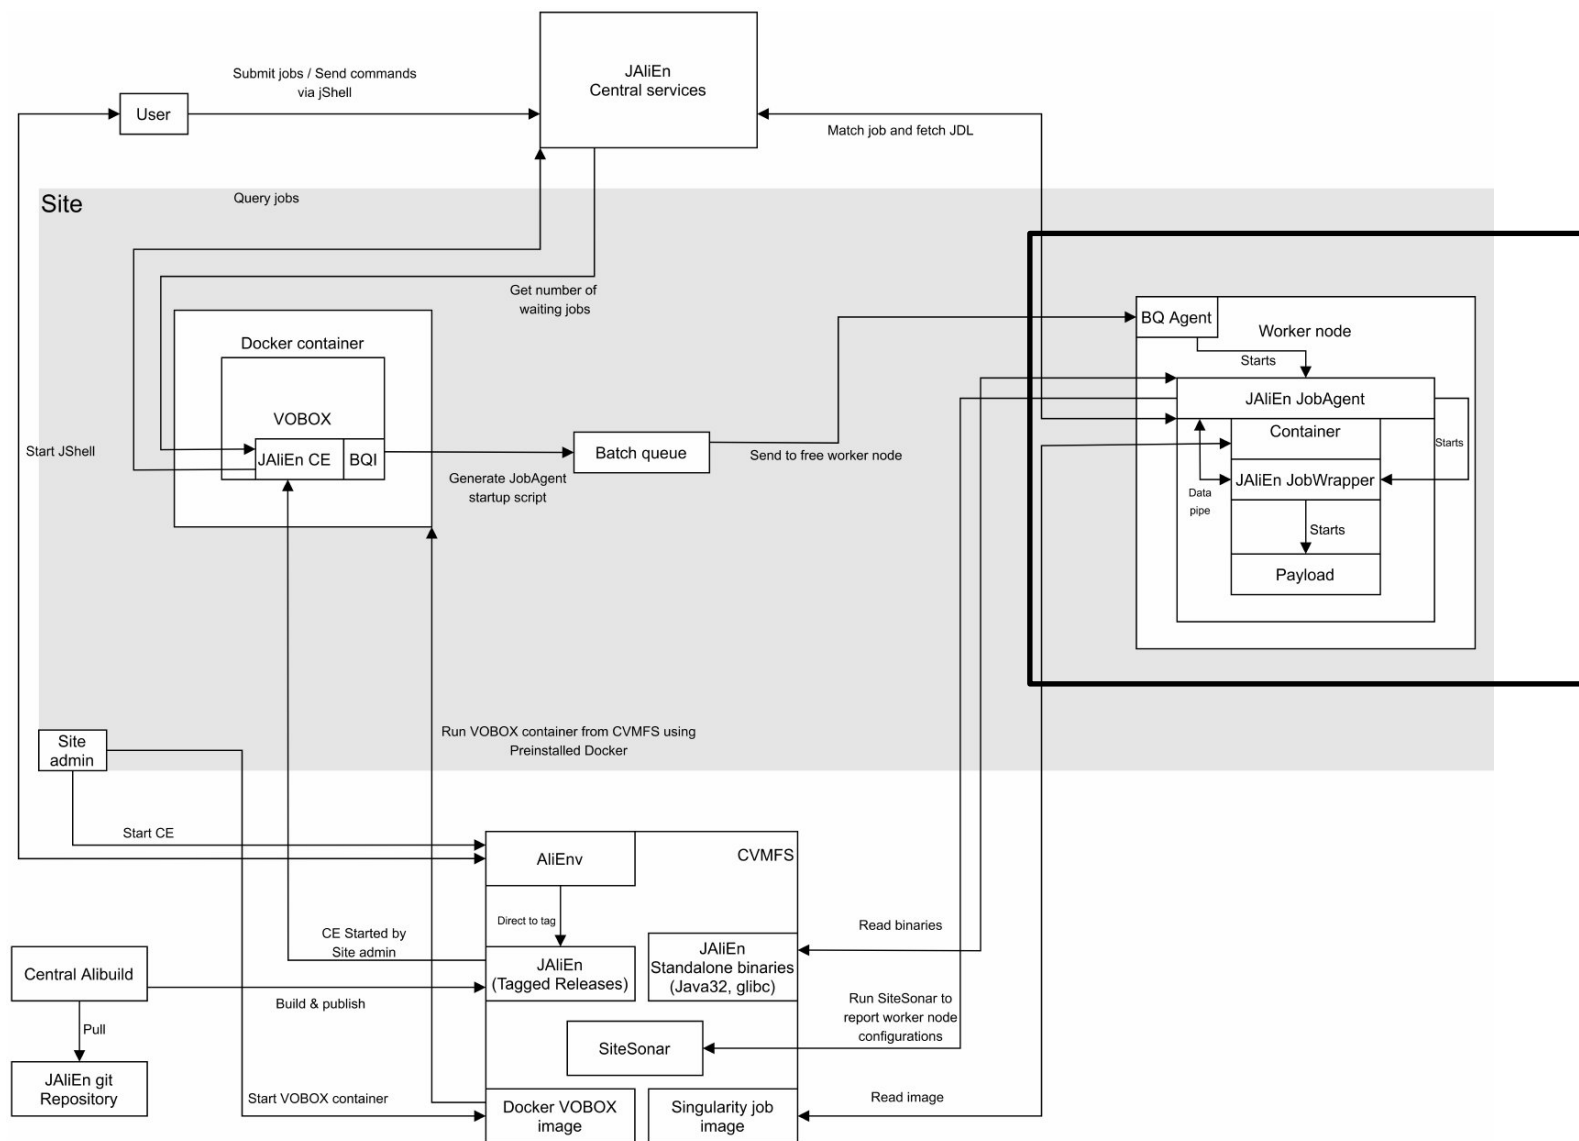

Background

- JAliEn features a **redesigned job pilot**
 - Deployed across **all JAliEn sites** (i.e. now nearly all sites)
 - Split into **multiple components** for each task
 - Provides for better isolation
 - Fully **standalone** via CVMFS
 - Environment, dependencies, core libraries: all in CVMFS
 - No other requirements or prior installations needed on worker nodes
 - Integrates **containers**, with all payload wrapped/isolated
 - Also fully standalone: runtime and container images all taken from CVMFS
 - Used automatically and by default on all jobs
 - GPU support
 - Allows better utilising **multicore**

Overview

Overview

Architecture

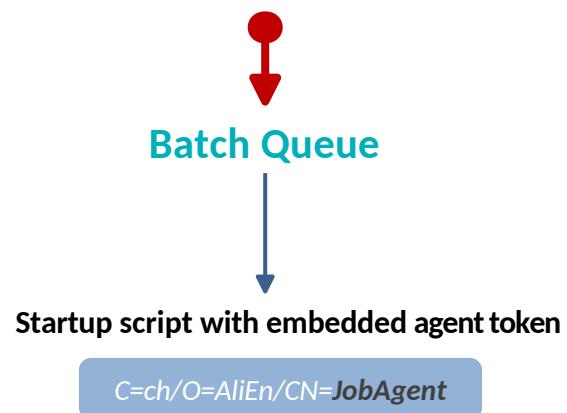

Batch Queue

Architecture

ALICE

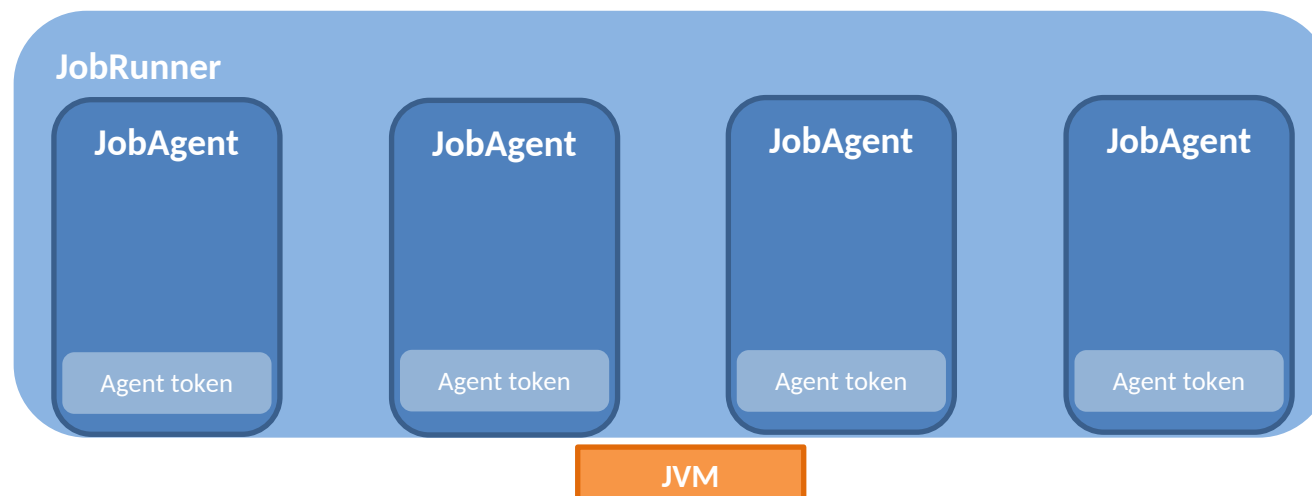

Architecture

ALICE

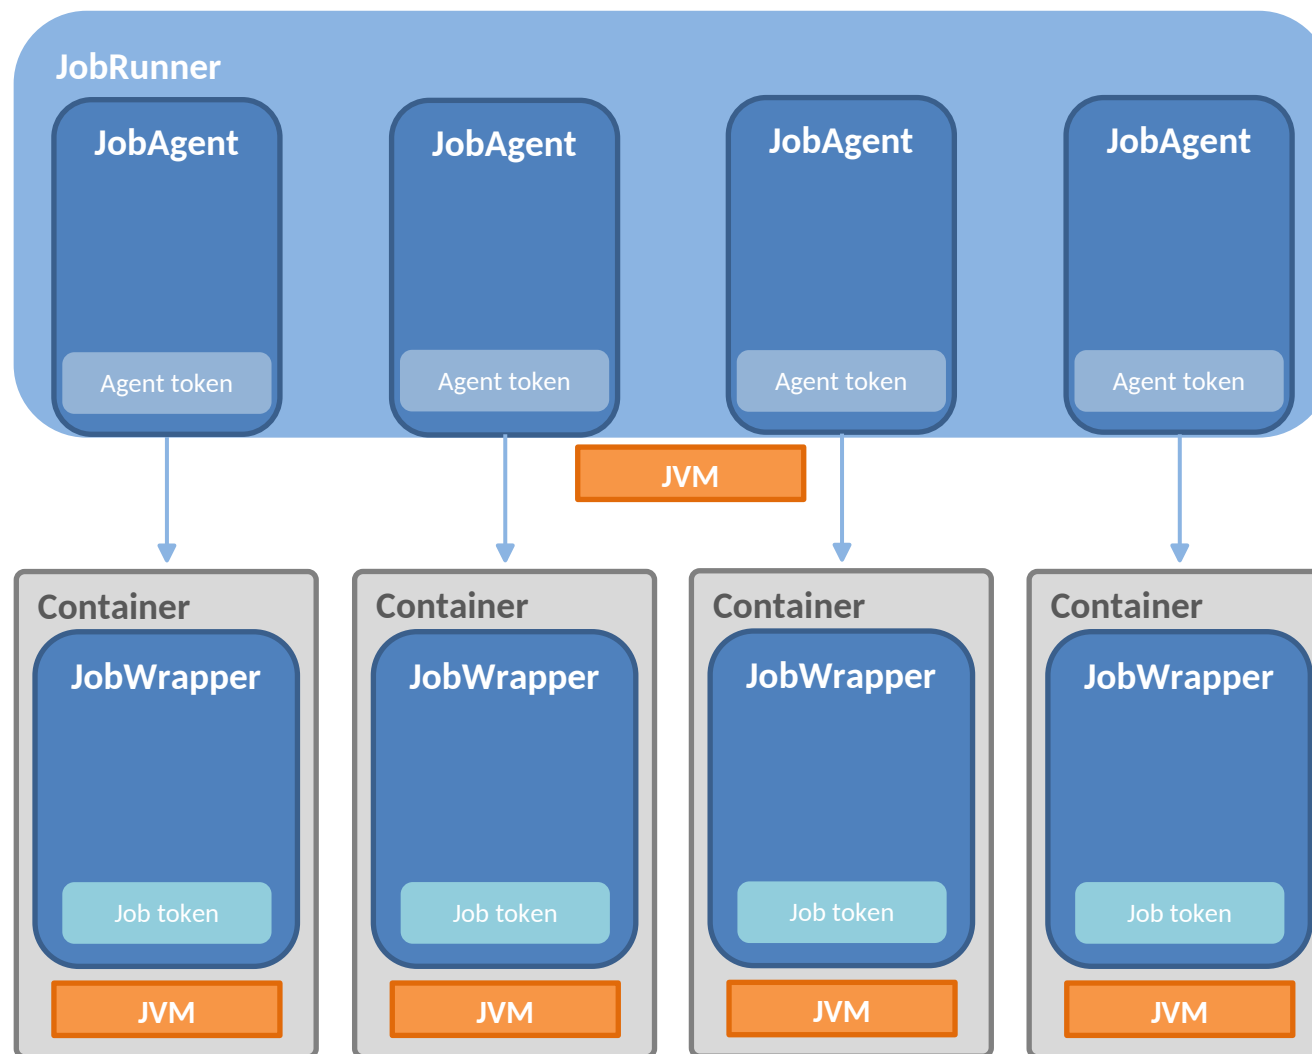

Architecture

ALICE

Architecture

Runner can spawn multiple agents/wrappers when there are free cores

Architecture: key points

- The old AliEn JobAgent is **now two independent components**
 - **JobAgent (JA)**: Job matching / monitoring
 - **JobWrapper (JW)**: Job execution / file handling
- Each has a token with just enough permissions for their tasks
 - **JA**: Agent token
 - **JW**: Job token
- Additionally, a **JobRunner (JR)** is provided for multicore
- Startup script from BQ calls everything it needs from CVMFS
- **32-bit JVMs** for minimal memory footprint
 - All needed 32-bit libraries bundled in CVMFS
- The JA will automatically **containerise** the JW and its payload
 - Tries multiple runtimes (Apptainer/Singularity/Podman), and uses whichever works on WN
 - All taken from CVMFS, but will fallback to local Singularity (or nothing) if none work
 - Needs *user namespaces* enabled for unprivileged runtimes from CVMFS

Payload container

- By default, **all** jobs are wrapped in a **CentOS 7.9** container
 - JAliEn jobdir mounted to “/workdir”
 - TMPDIR is “/workdir/tmp”, and “/tmp” also points here
- Image as a sandbox directory located in CVMFS at
 - /cvmfs/alice.cern.ch/containers/fs/singularity/centos7
- Build recipe available on [Gitlab](#)
 - In case of package requests —> add PR
- Two optional images available (can be set in config)
 - **Rocky 8.6**: For newer payloads (no ROOT5) and GPUs¹
 - **Rocky 9.0**: Testing only (no production use)
- ¹**GPUs are supported** when using *Apptainer* (formerly Singularity)
 - Drivers may require EL8+ for this

Configuration options

The new job pilot (JobAgent/Jobwrapper) can be customised (to some extent)

- Specific version for the pilot can be selected, independent of CE
 - By default, JobAgents will match the CE JAliEn version
- Custom JA executable possible
- Different container images can be selected
 - Custom containers also possible
 - Per site only - **not** per job
- Use of containers can also be completely disabled
- Default configuration directory: **~/.alien/config** on the VO-Box
 - Initial versions used **~/.j/config** —> now changed

Pilot behaviour

- The new JobAgent is *mostly* transparent to the end-users
- However, some, notable differences exist
 - Changed state transitions
 - No more **SAVED**
 - Re-introduction of **ERROR_S**
 - Specified outputfile in JDL not found
 - Always upload a default output for ERROR jobs, if nothing else specified
 - Uploaded, not registered
 - Strict TTL enforcement
 - 1hr grace period for upload provided, but payload always killed immediately
 - Presence of core dumps will abort job
 - Consequences of containerisation
 - Environment
 - Different directory structure (jobdir is *always* **/workdir**)
 - Needed for unprivileged containers

Traces

```

← JobWrapper exits after upload. Code nonzero only if JA/JW issue

Recent JobAgent changes

- **1.5.8** and most recent versions
 - JobAgent / JobWrapper refactor
 - Podman support
 - JDK18+ support
 - Better error detection
 - First steps towards SiteSonar integration
 - Removal of old workarounds
 - Better GPU forwarding
 - TTL fix
 - Heartbeat monitor detected fix
 - Abort if corefiles present
- Changelog will now be provided for each tag on [Gitlab](#)

Upcoming JobAgent changes

- Tuning of edge cases
 - Heartmon will remain for a while longer
- SiteSonar integration
 - Also used for jobmatching
- Retire SingularityCVMFS runtime
 - Fully replaced by Apptainer
 - Local Singularity will remain as fallback
- CPU task isolation
- **Fine-grained resource control per job**
 - Num. CPUs per container
 - CPUtime utilisation / constraints
 - Exposed memory / limits
 - Available swap
 - I/O limits

Upcoming JobAgent changes

- Tuning of edge cases
 - Heartmon will remain for a while longer
- SiteSonar integration
 - Also used for jobmatching
- Retire SingularityCVMFS runtime
 - Fully replaced by Apptainer
 - Local Singularity will remain as fallback
- CPU task isolation
- **Fine-grained resource control per job** —>
 - Num. CPUs per container
 - CPUtime utilisation / constraints
 - Exposed memory / limits
 - Available swap
 - I/O limits

However, requires **Cgroups v2** on host

- Not available on CentOS 7!
 - EL8/EL9+ only
- Also, C7 EOL is not too far off
- Possibly better for multicore
- A first nudge to **update** to EL8/EL9...

Moving to EL8/EL9

- Note: CentOS was **discontinued** and retired by RedHat on 31/12/2021
 - C8 completely abandoned
 - C7 will remain until EOL
- CentOS Stream will remain as upstream build
 - “Beta-channel” for RHEL
 - Halved support window
- CERN entered a licence agreement for allowing the use of RHEL
 - Valid on CERN premises only
- CentOS successor projects (1:1 RHEL rebuilds)
 - **Rocky Linux** – Founded by original CentOS creator
 - **AlmaLinux** – Backed by CloudLinux
- What to use...?

Moving to EL8/EL9

- Note: CentOS was **discontinued** and retired by RedHat on 31/12/2021
 - C8 completely abandoned
 - C7 will remain until EOL
- CentOS Stream will remain as upstream build
 - “Beta-channel” for RHEL
 - Halved support window
- CERN entered a licence agreement for allowing the use of RHEL
 - Valid on CERN premises only
- CentOS successor projects (1:1 RHEL rebuilds)
 - **Rocky Linux** – Founded by original CentOS creator
 - **AlmaLinux** – Backed by CloudLinux
- What to use...?

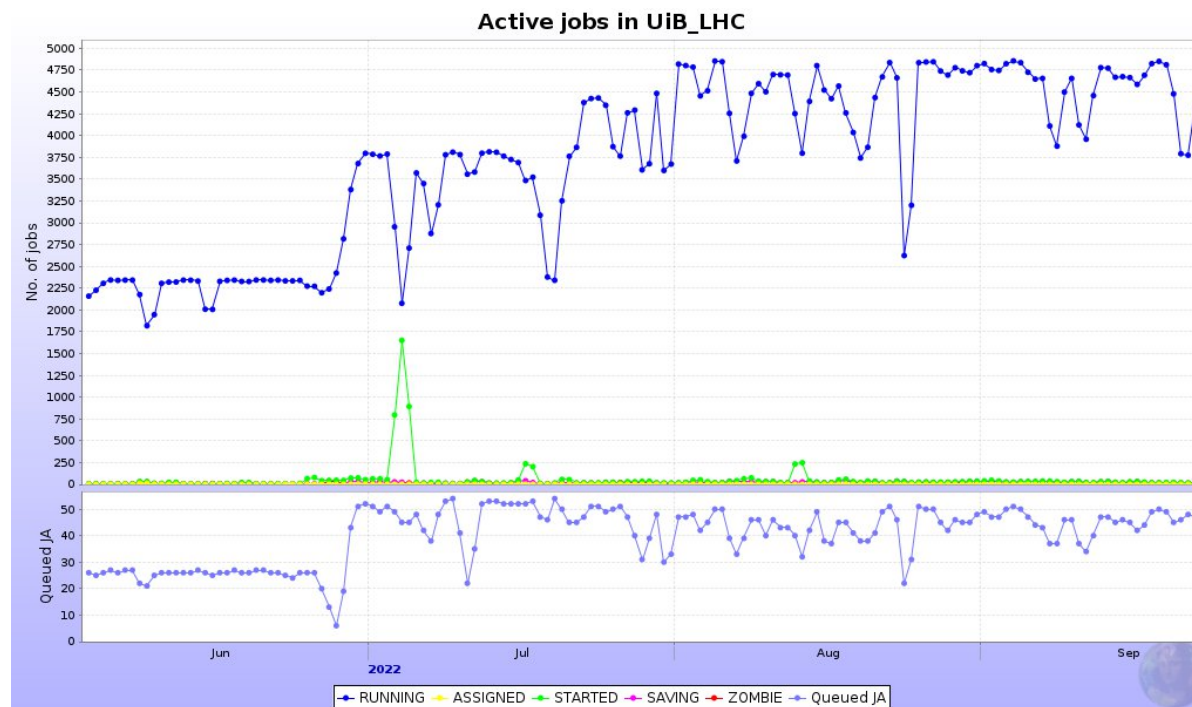

“GDB recommends Red Hat Enterprise Linux, CentOS Stream and Enterprise Linux Clones (ELCs) should be treated equally
– *ELCs defined as 100% functionally equivalent to RHEL such as Rocky or Alma”*

Moving to EL8/EL9

- JAliEn and the JobAgent/JobWrapper already supports both EL8 and EL9
 - CERN is set to **skip** EL8 and go directly to EL9
 - EL8 to be used if compatibility needs it
- In other words, ideally
 - If RHEL licence available: **RHEL 9**
 - For quicker releases, and OK with shorter EOL window: **CentOS Stream 9**
 - If wanting a 1:1 CentOS replacement: **Rocky Linux 9** or **AlmaLinux 9**
- Warning: Rocky and Alma are the **only** supported ELCs
 - Other rebuilds, even if they are fully 1:1, will not work
 - Packages often rely on distro version strings

Moving to EL8/EL9

- Updated sites already exist
 - Example: **UiB** worker nodes running on AlmaLinux 8 since mid-June 2022

Summary and outlook

- JAliEn features a **redesigned job pilot**
 - Default across **all JAliEn sites**
 - Split into **multiple components** for each task
 - Provides for better isolation
 - Fully standalone via CVMFS
 - Integrates **containers**, with all payload wrapped/isolated
 - Mostly **transparent** to the end-user
- Changes still to come
 - SiteSonar integration
 - Better compatibility
 - Improved **resource control**
 - Will require **EL8/EL9** on site worker nodes

Thank You
