Higgs or Higg**s**?

What's there outside the SM?

What's there outside the SM?

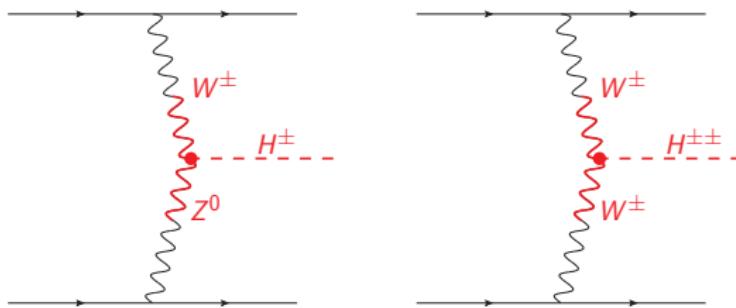

What's there outside the SM?

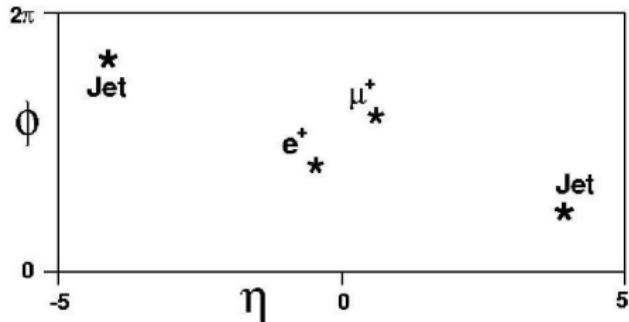

- Several models
- Different representation for Higgs multiplets
 - Triplet models (LH, GM, L-R) contain a $W^\pm Z^0 \rightarrow H^\pm$ vertex at tree level
 - Doubly charged Higgs included in these models
- Charged Higgs production via VBF allowed and visible @LHC

for a review of feynman rules, see Godfrey, Moats: arXiv:1003.3033

Asakawa, Kanemura, Kanazaki: arXiv:hep-ph/0612271

VBF signature

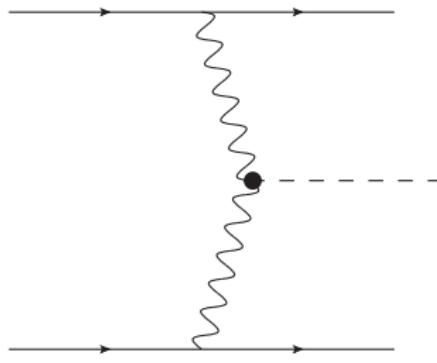

- 2 hard tagging jets
- Large rapidity separation between jets
- No (or small) hadronic activity between tagging jets
- Higgs decay in the central rapidity region
- Possibility to measure VVH couplings → **distinguish among different models**

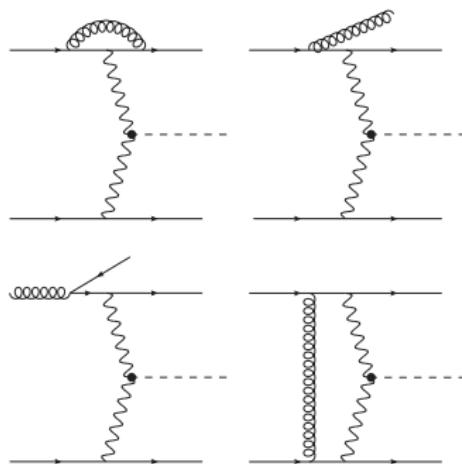

QCD corrections to VBF

QCD corrections to VBF

LO

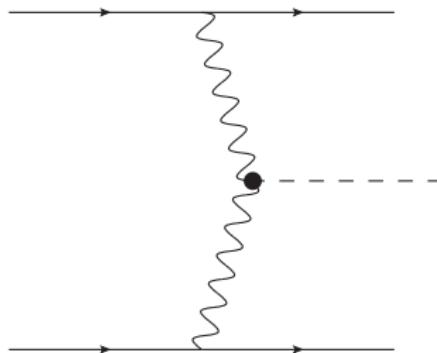

NLO

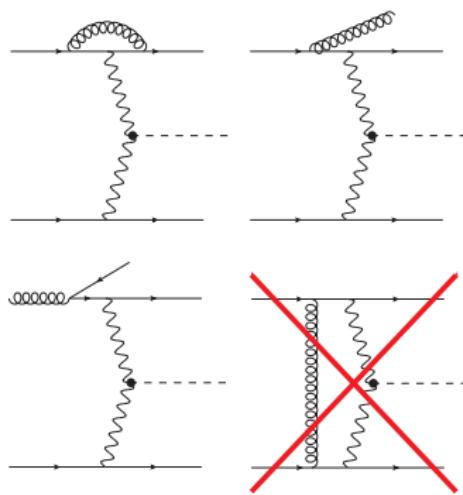

QCD corrections to VBF

LO

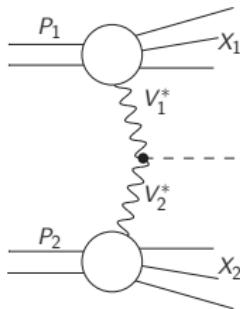

NLO

QCD corrections to VBF

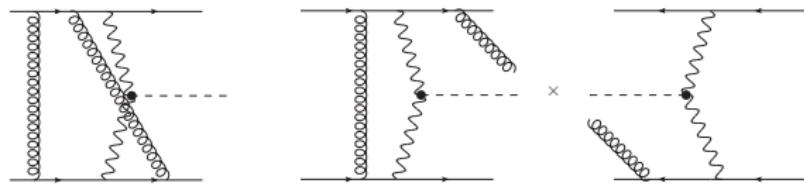

At NLO:

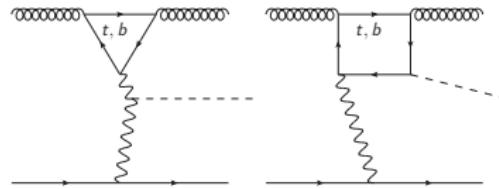

$$d\sigma = \frac{1}{S} \frac{G_F^2 M_{V_1}^2 M_{V_2}^2}{(Q_1^2 + M_{V_1}^2)^2 (Q_2^2 + M_{V_2}^2)^2} W_{\mu\nu}^{DIS}(x_1, Q_1^2) \mathcal{M}_{VVH}^{\mu\rho} \mathcal{M}_{VVH}^{*\nu\sigma} W_{\rho\sigma}^{DIS}(x_2, Q_2^2) \times \\ \times \frac{d^3 P_{X_1}}{(2\pi)^3 2E_{X_1}} \frac{d^3 P_{X_2}}{(2\pi)^3 2E_{X_2}} ds_1 ds_2 \frac{d^3 P_H}{(2\pi)^3 2E_H} (2\pi)^4 \delta^4 (P_1 + P_2 - P_{X_1} - P_{X_2} - P_H)$$

The structure function approach to VBF @ NNLO

- structure function approach is not exact at NNLO
- (in principle) need to consider extra contributes
 - double gluon-exchange diagrams (real and virtual)

- t/b loop diagrams

Results at colliders

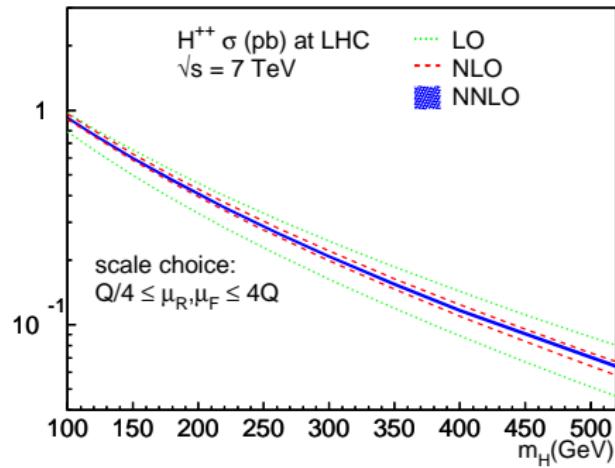

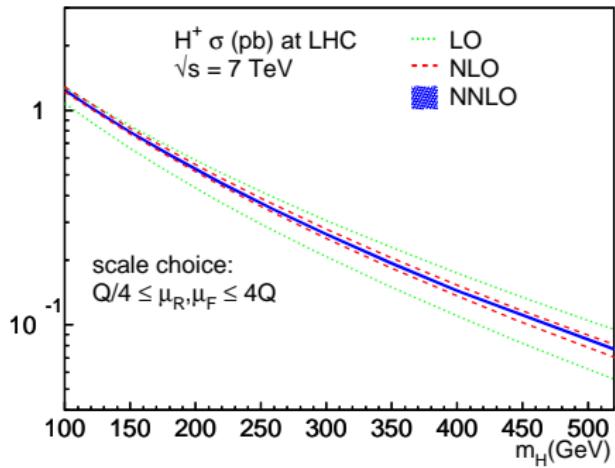

VVH couplings (arXiv:1003.3033)

- $V_1 V_2 H$ Feynman rule:

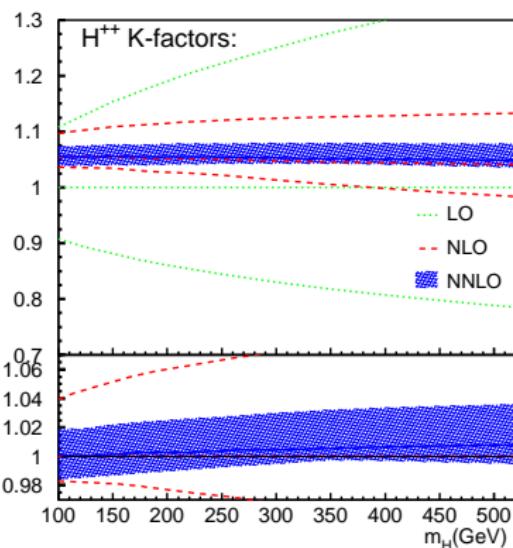

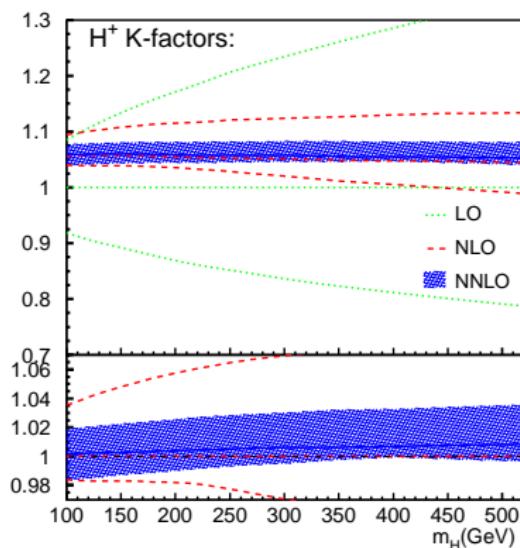

A Feynman diagram illustrating the $V_1 V_2 H$ coupling. It features two wavy lines representing gauge bosons, labeled V_i and V_j , which meet at a vertex connected to a dashed line representing the Higgs boson (H). The wavy lines are labeled with indices μ and ν at their vertices. To the right of the diagram is an equals sign followed by the expression $= 2(\sqrt{2}G_F)^{1/2} M_i M_j F_{ij} (-i g_{\mu\nu})$.

- F_{ij} **model dependent**
- All numbers computed with $F_{ij} = 1$

Total cross-sections @LHC - $\sqrt{s} = 7\text{TeV}$

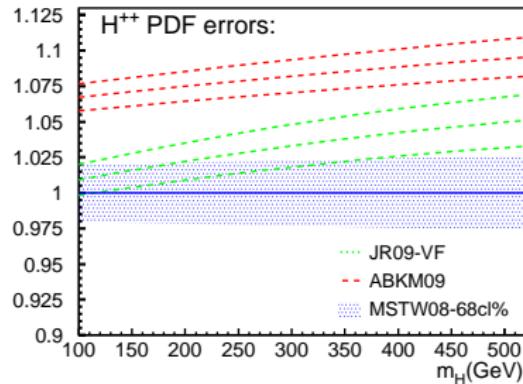

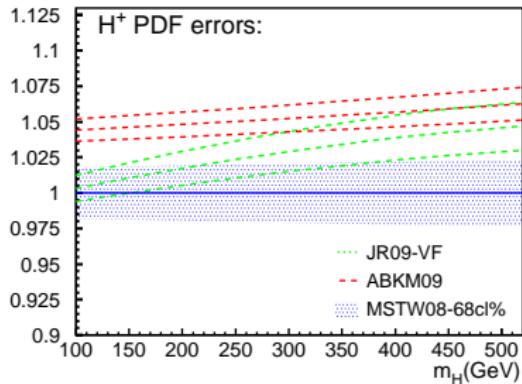

K-factors @LHC - $\sqrt{s} = 7\text{TeV}$

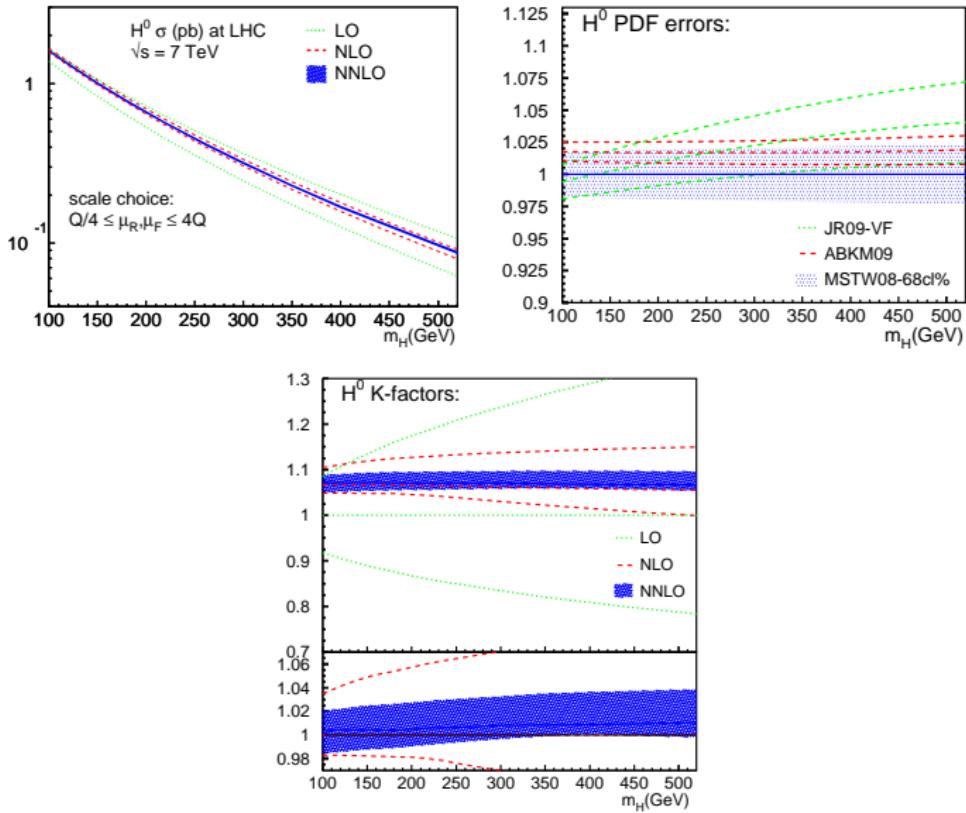

Scale choice: $1/4Q \leq \mu_R, \mu_F \leq 4Q$

NNLO PDF errors @LHC - $\sqrt{s} = 7\text{TeV}$

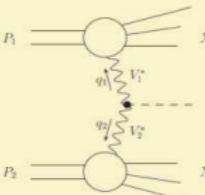

The SM Higgs @LHC - $\sqrt{s} = 7\text{TeV}$

VBF @ NNLO : Cross-Section Calculator

by P. Bolzoni, F. Maltoni, S.-O. Moch and M. Zaro

Version 0.5 -- 31 August 2010

Higgs production in vector-boson fusion (VBF) is computed via a structure-function approach, as reported in [ArXiv:1003.4451 \[hep-ph\]](#). In addition to the SM Higgs boson, it is also possible to compute the VBF process for a generic scalar (neutral, singly or doubly charged) that [couples](#) to the SM vector bosons.

This simple interface allows any [registered](#) user to obtain a cross section up to NNLO in QCD, including an estimate of the theoretical uncertainties coming from scale variation and PDF uncertainties.

The electro-weak parameters used for the cross-section computation are set to their respective [PDG](#) values (see the list [here](#)).

The code runs over the CP3-MadGraph cluster and [might take up to a few hours](#) depending on the actual request. An e-mail with a link to the results page is sent to the user as soon as results are available. The possibility of requesting multiruns, i.e. runs corresponding to a series of Higgs mass values and/or collider energies, will be available soon upon e-mail request.

[Registration](#) [Talks & Conferences](#) [HNNLO web page \(gg>H\)](#)

pdf err +/-:	not req.	not req.	not req.

Conclusions:

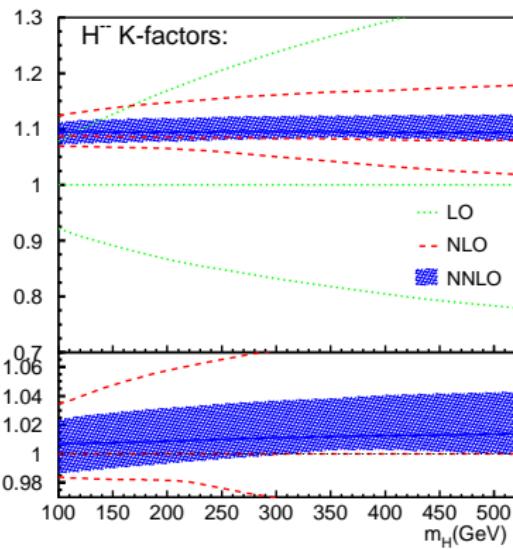

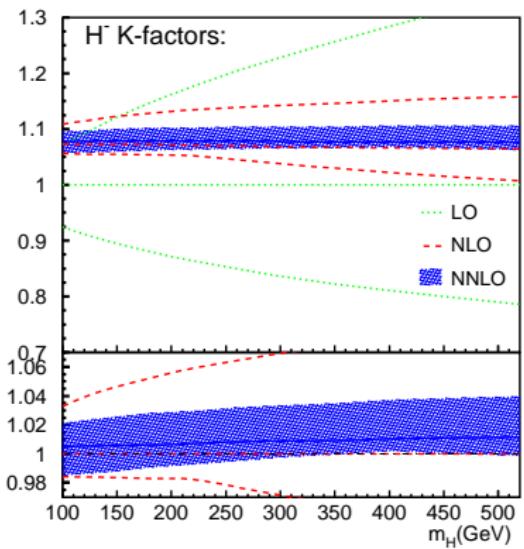

- Triplet models allow sizable VBF production for charged Higgses
- QCD corrections to VBF can be computed via a structure function approach
- VBF total cross-sections and K-factors available at NNLO (H^\pm , $H^{\pm\pm}$)
- Excellent convergence of perturbative series
- Theoretical uncertainties reduced at $\pm 2\%_{SC} \pm 5\%_{PDF}$ level at NNLO
- Flexible web interface available
- Easy extension to different Lorentz structures for the VVH vertex
- TO DO: Differential calculation (at least at NLO)

K-factors @LHC - $\sqrt{s} = 7\text{TeV}$

Are pdf uncertainties correlated to the Higgs charge?

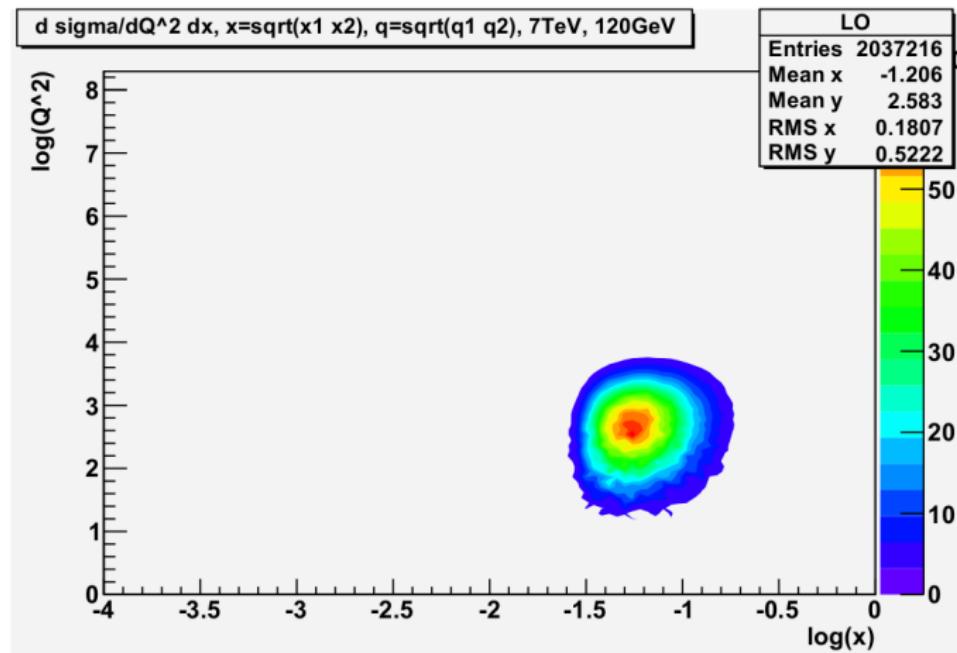

Single quark line (SQL) diagrams

- Gauge invariant class
- Not “pure” VBF process (colour exchanged between protons)
- Not IR-safe
- Studied by R. V. Harlander, J. Vollinga and M. M. Weber, Phys. Rev. D **77**, 053010 (2008) [arXiv:0801.3355 [hep-ph]]
- Impact on the VBF cross section (after VBF cuts) $\mathcal{O}(10^{-3})$

Kinematics in the x vs. Q^2 plane

$$\langle Q^2 \rangle \simeq (20\text{GeV})^2$$

$$\langle x \rangle \simeq 6 \cdot 10^{-2}$$
