

# Status of dry-run planned for the SPS

K. Li for the SPS Commissioning and Operations team

SPS MCM 27. January 2020

Kevin Li

### ATIM updates

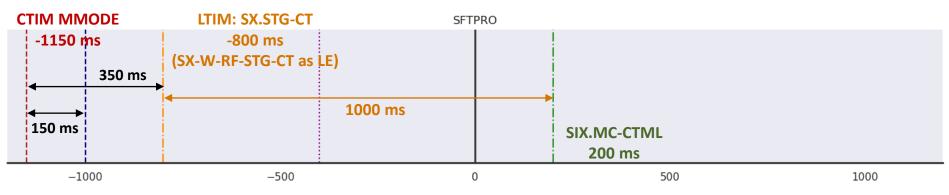

- ATIMs during coast:
  - At configuration pulse, ATIM needs to know whether next machine mode is cycling or coast to prepare timings for next cycle!
  - Agreed with timing team to add a new timing event at 1150 ms before start of cycle then next machine mode is available. This is also the event that is used as "configuration pulse" and triggers the configuration phase for the ATIMs.

- ATIMs start timing generator:
  - Use a forewarning start cycle (FCY1K) as load event for the LTIM
  - Trigger occurrence with respect to injection forewarning equivalent F1KFO; use Makerules
     to compute delays from FCY1K
  - Original plan to use a new event similar to F1KFO, occurring also in case of missed injection, brought many more complications
  - We got a separate configurable timing event here as well, that we can use as load event to start the timing generator SX.RF-STG-CTML with first injection and SX.W-RF-STG-CTML currently set at 1k seconds before first injection

## ATIM cycle architecture

- New timing event at **1150 ms before start cycle** to trigger ATIM configuration and carrying machine mode
- Load event forewarning **1s before start cycle** (SX.FCY1K-CT) is used for start timing generator (SX.STG-CT)
- SX.STG-CT now triggered directly via SX.W-RF-STG-CT no more makerules needed here
- Start timing generator delay computed to occur with forewarning 1s before first injection via Makerule:
  - SX.STG-CT load event = SX.FCY1K-CTML
  - SX.STG-CT delay = SIX.MC-CTML + SX.F1KFO-CTML SX.FCY1K-CTML
- Earliest possible start timing generator can occur 150 ms after trigger ATIM configuration
- For SFTPRO, which is earliest possible injection time today the start timing generator occurs 350 ms after start ATIM configuration -> well within the chosen window of 200 ms (with margins)

## Last ATIM dry run done 18. December 2019

### LSA RF preparations – 27. January 2020

- LSA RF clean-up implemented some minor items still to be checked
- High level parameters for cavity control mostly in LSA
- LQR beam control partly in LSA
- RF synchro in LSA and ready with value generators
- ATIMs value generators in the making

## Two dry runs foreseen for execution

- Week 5 RF: LHC cycle generation:
  - Cavity control:
    - High level settings (bucket area, synchrotron tune)
    - Total voltage generation and propagation
    - Missing: dpOverP, full links to 800 phase offset
  - Beam control:
    - LQR for radial and synchro loops
  - RF synchro:
    - Cleaned up value generators ready for test
  - Timing:
    - Value generators in the making FESA classes subset ready for deployment
  - Re-phasing:
    - Value generators ready on paper wait for FESA class

## Two dry runs foreseen for execution

- Week 5 RF: LHC cycle generation:
  - Cavity control:
    - High level settings (bucket area, synchrotron tune)
    - Total voltage generation and propagation
    - Missing: dpOverP, full links to 800 phase offset
  - Beam control:
    - LQR for radial and synchro loops
  - RF synchro:
    - Cleaned up value generators ready for test
  - Timing:
    - Value generators in the making FESA classes subset ready for deployment
  - Re-phasing:
    - Value generators ready on paper wait for FESA class

## Two dry runs foreseen for execution

### • Week 4 ALPS:

- BA3 FIFO
- BA3 Orbit
- BA3 Injection trajectory

### • Status → moved to Thursday, 6 February (FESA classes still needed some final works)

- FESA classes are now ready
- All features implemented in YASP (Jorg):
  - First turn: choice of
    - FIFO
    - any injection (1-16)
  - Orbit: choice of
    - triggered single acquisition available shortly after the selected cycle time
    - cycle acquisition (at the end of the cycle), either for a single selected time or the evolution along the cycle
  - Settings can also be configured from YASP
- Ready for dry run on ...

#### • Next:

- Monday March 2: Multi-turn (simulating a BST triggered oscillation on the simulated position), logging depending on what is there
- Tuesday May 12: Test interlocks algorithms Validation of the algorithm via emulated bumps and oscillations
- Week 24: BIS checks Andrea to see with Ivan Ramirez

www.cern.ch

### Overview

- Dry run: full (sub-)system functionality tests in operational conditions
- Plan and schedule tests per equipment or system ideally from highest level (application) through LSA/INCA and FESA down to hardware
- Identified different groups of tests established a list of tests and an idea of when to schedule these
- Tests will start early next year (February 2020)
- Not all tests can be done immediately full vertical slice; we will need to go staged tests – as far up and as far down as we can go; we will show an example for the RF tests

## Tests list – BI ALPS

### Tests list – EPC

.

Name	Week	Description
		FGC interface
FGC interfaces	Check	available
		Check settings
		generation and
		management in LSA
LSA integration	10	complete
		Simulation tests for
		state control, interlock,
	DR 1	acquisition, pc
FGC tests	DN 14	check,
Economy modes,		Test FGCs in special
COAST etc.	14	machine modes
		FEI tests in TT10 and
FEI tests	22	after fast extraction
		FEI in TT10 with BHZ
FEI tests		during HWC

- FGC dry run in simulation mode (new mains and cods):
  - All applications
  - State control
  - Acquisition
  - SIS
  - Different modes, coast economy,...
- FEI dry runs:
  - For given BI node can set converters to test mode, will drive A channel to true and can read channel
  - Real interlockfunctnality check is taken out of chain in simulation mode
- BHZ dry runs when ready to test? Comments from David:
  - Preconditions: gateway and BIS in place, need to be able to drive permit out of interlock system; also need to be able to mask all inputs, all functions set up for TT10 for TT10 PC giving FEI conditions to true; check different energy levels prepare different cycles. Dry run to check permits come in.
  - We cannot run TT10 PCs just in simulation mode, thus, we will need to do a full dry run of the BHZ only during the HWC period.
  - Running in simulation mode, one could however still run it through the FEI application and check at least the anticipated results. (Actual result will always be false as we are in simulation) – run FEI app in a couple of scenarios – this is already planned.
  - David recommends to target the first week of August for the BHZ dry run; that would fit with the PS schedule. To be negotiated with the PS. He also recommends the first things to drive and check TT10 settings try several attempts first August to mid September.

## Tests list – SBDS

Name	Week	Description
		Test individual TIDVG
		sensors readings that
		will go into the SIS;
		SIS and TIDVG
TIDVG FESA classes	2	4 monitoring application
SBDS individual FESA		Signals, post-mortem
classes	3	2 push
		Verify arming
		sequence of SBDS
SBDS	4	2 alone
		Verify arming
SBDS + f_rev +		sequence of SBDS
injection + BIS	4	2 with RF and BIS
		measurements of
		delays, validate time
		between dump
SBDS TSU, MKD, BIS	DRI 4	2 request and pulse
		Test of SBDS arming
		and pulsing with
		different SC
		configurations (very
SBDS + f rev +		important to test all possible
injection + BIS	Л	2 configurations)
	4	Test of individual
SBDS PM bins, SBDS		interlocks, test of
and TIDVG FESA		analysis, test of
classes	Δ	2 python server for BTV
0140000		

F. Velotti

- Different steps of what needs to be tested here
- Systems dry runs will be done already before as system test
- Injection tests:
  - BIS loop must be closed as of week 42.
  - Check the events for injection BIS; timing distribution which will be used by FGCs on BHZ check with Stephane whether this is already part of HWC.
- TIDVG FESA classes as soon as it is ready week 24 (application dry run)
  - Erik and Yannick to prepare SIS and TIDGV monitoring application
  - Can test TIDVG in signals → check whether we will get some simulated data... (temperature, cooling, LVTD... tbd)
- Test of individual classes for the SBDS week 32 (PM beans which could come later):
  - Kickers, TSUs, check signals, post-mortem push
  - Not much needed around this inter terms of applications etc.

٠

### Tests list – RF

Name	Week Description
	Test LSA generation for
	LHC type cycle with RF
	synchro, RF loops, RF
LHC generation	5 cavity control & timings
	Test settings for radial
	steering on synchro and
Radial steering	8 radial loop
SPS2PS Synchro	10 Test synchro
	Test acquisition and display
Synchro & phase loop	of synchro and phase errors
diagnostics	13 using simulated data
ulagnostics	
	Test generation and settings
	of full cavity control loops –
Cavity control loops	16 with comb filters
	Test LSA generation for
	SFTPRO type cycle of RF
	synchro, RF loops, RF
SFTPRO generation	22 cavity control & timings
	Test acquisition and display
Phase & position	of phase and position using
diagnostics	25 simulated data
	Test what can be tested
	from diagnostics not tested
Diagnostics test	27 so far
0	Verify settings in 800 MHz;
	improve generation using
	new functions for voltage
	ratio, add harmonic ratio,
800 MHz	29 add offset
	Generate ion cycle with FFA
FFA generation	31 – all settings; also synchro
T A generation	Interface and settings for
	longitudinal damper ready
Longitudinal domnor	33 for testing
Longitudinal damper	33 TOF LESLING
	Interface and settings for RF
RF gymnastics	36 gymnastics ready for testing
	Interface and settings for
	longitudinal blow-up ready
Longitudinal blow-up	39 for testing
	Generation and settings with
AWAKE and LHC rephasing	40 tests for rephasing
	Slip stacking application
	ready with preparation of
Slip stacking application	44 functions for settings

#### • Staged tests

• HW not available from start of tests – test as far vertical as possible, coming from both sides

#### Requirements

- Test crate on TN trusted
- HW progressively coming in
