**Final
Black Hole**

Typical black-hole merger signal

Masses in the Stellar Graveyard

LIGO-Virgo-KAGRA Black Holes *LIGO-Virgo-KAGRA Neutron Stars* *EM Black Holes* *EM Neutron Stars*

- Barely any (visible) pre-merger emission
 - Remnant: intermediate-mass black hole.
 - If BBH: primary black hole in the pair instability supernova gap.

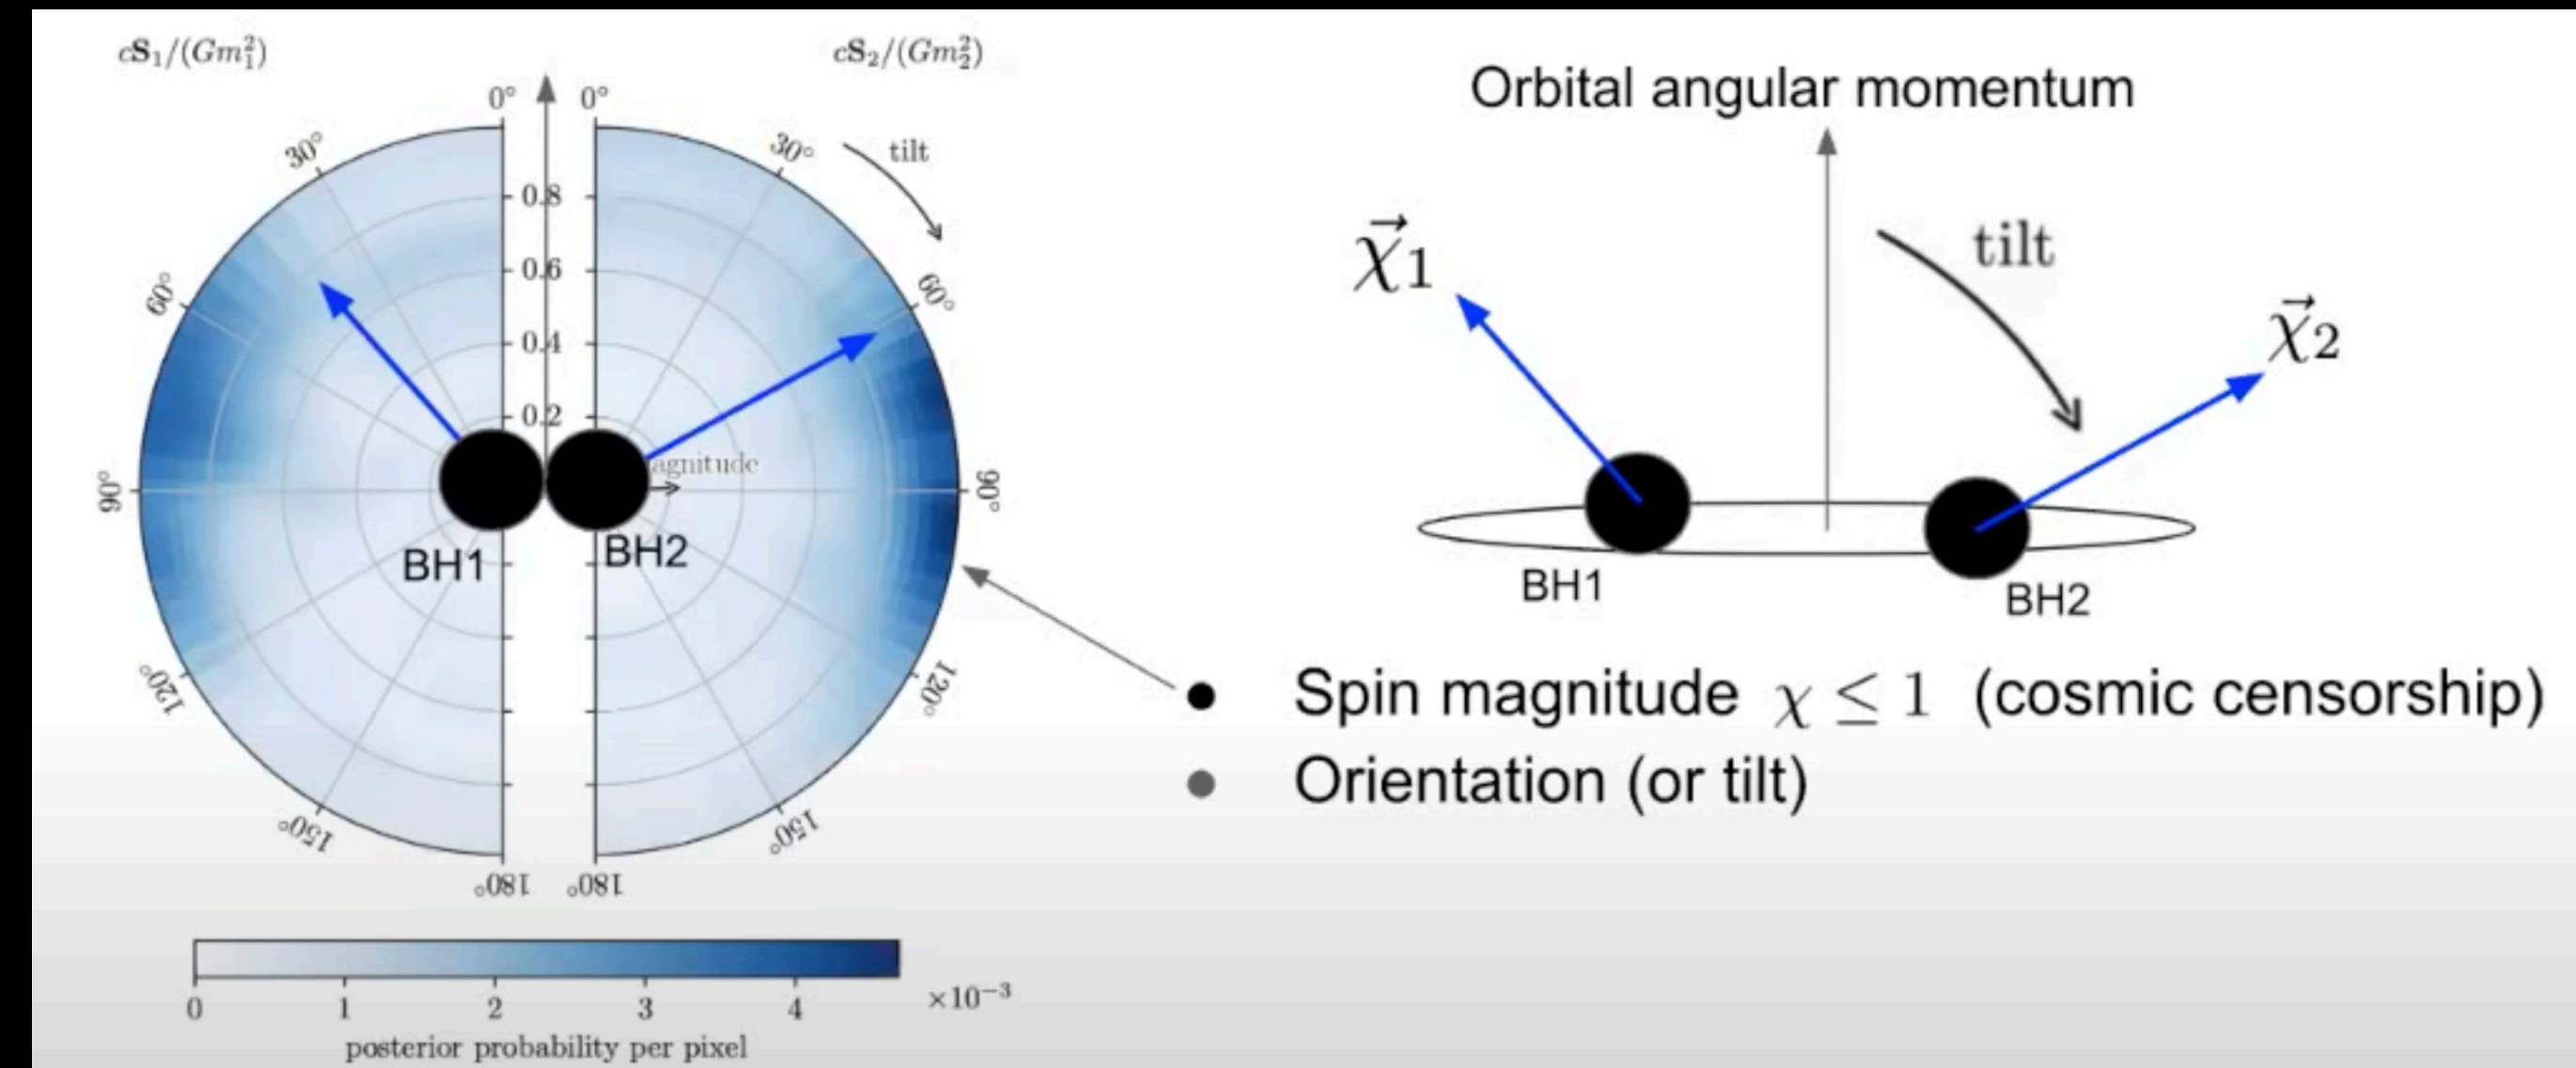

- Barely any pre-merger emission
 - Remnant: intermediate-mass black hole.
 - If BBH: primary black hole in the pair instability supernova gap.

LVC 2020

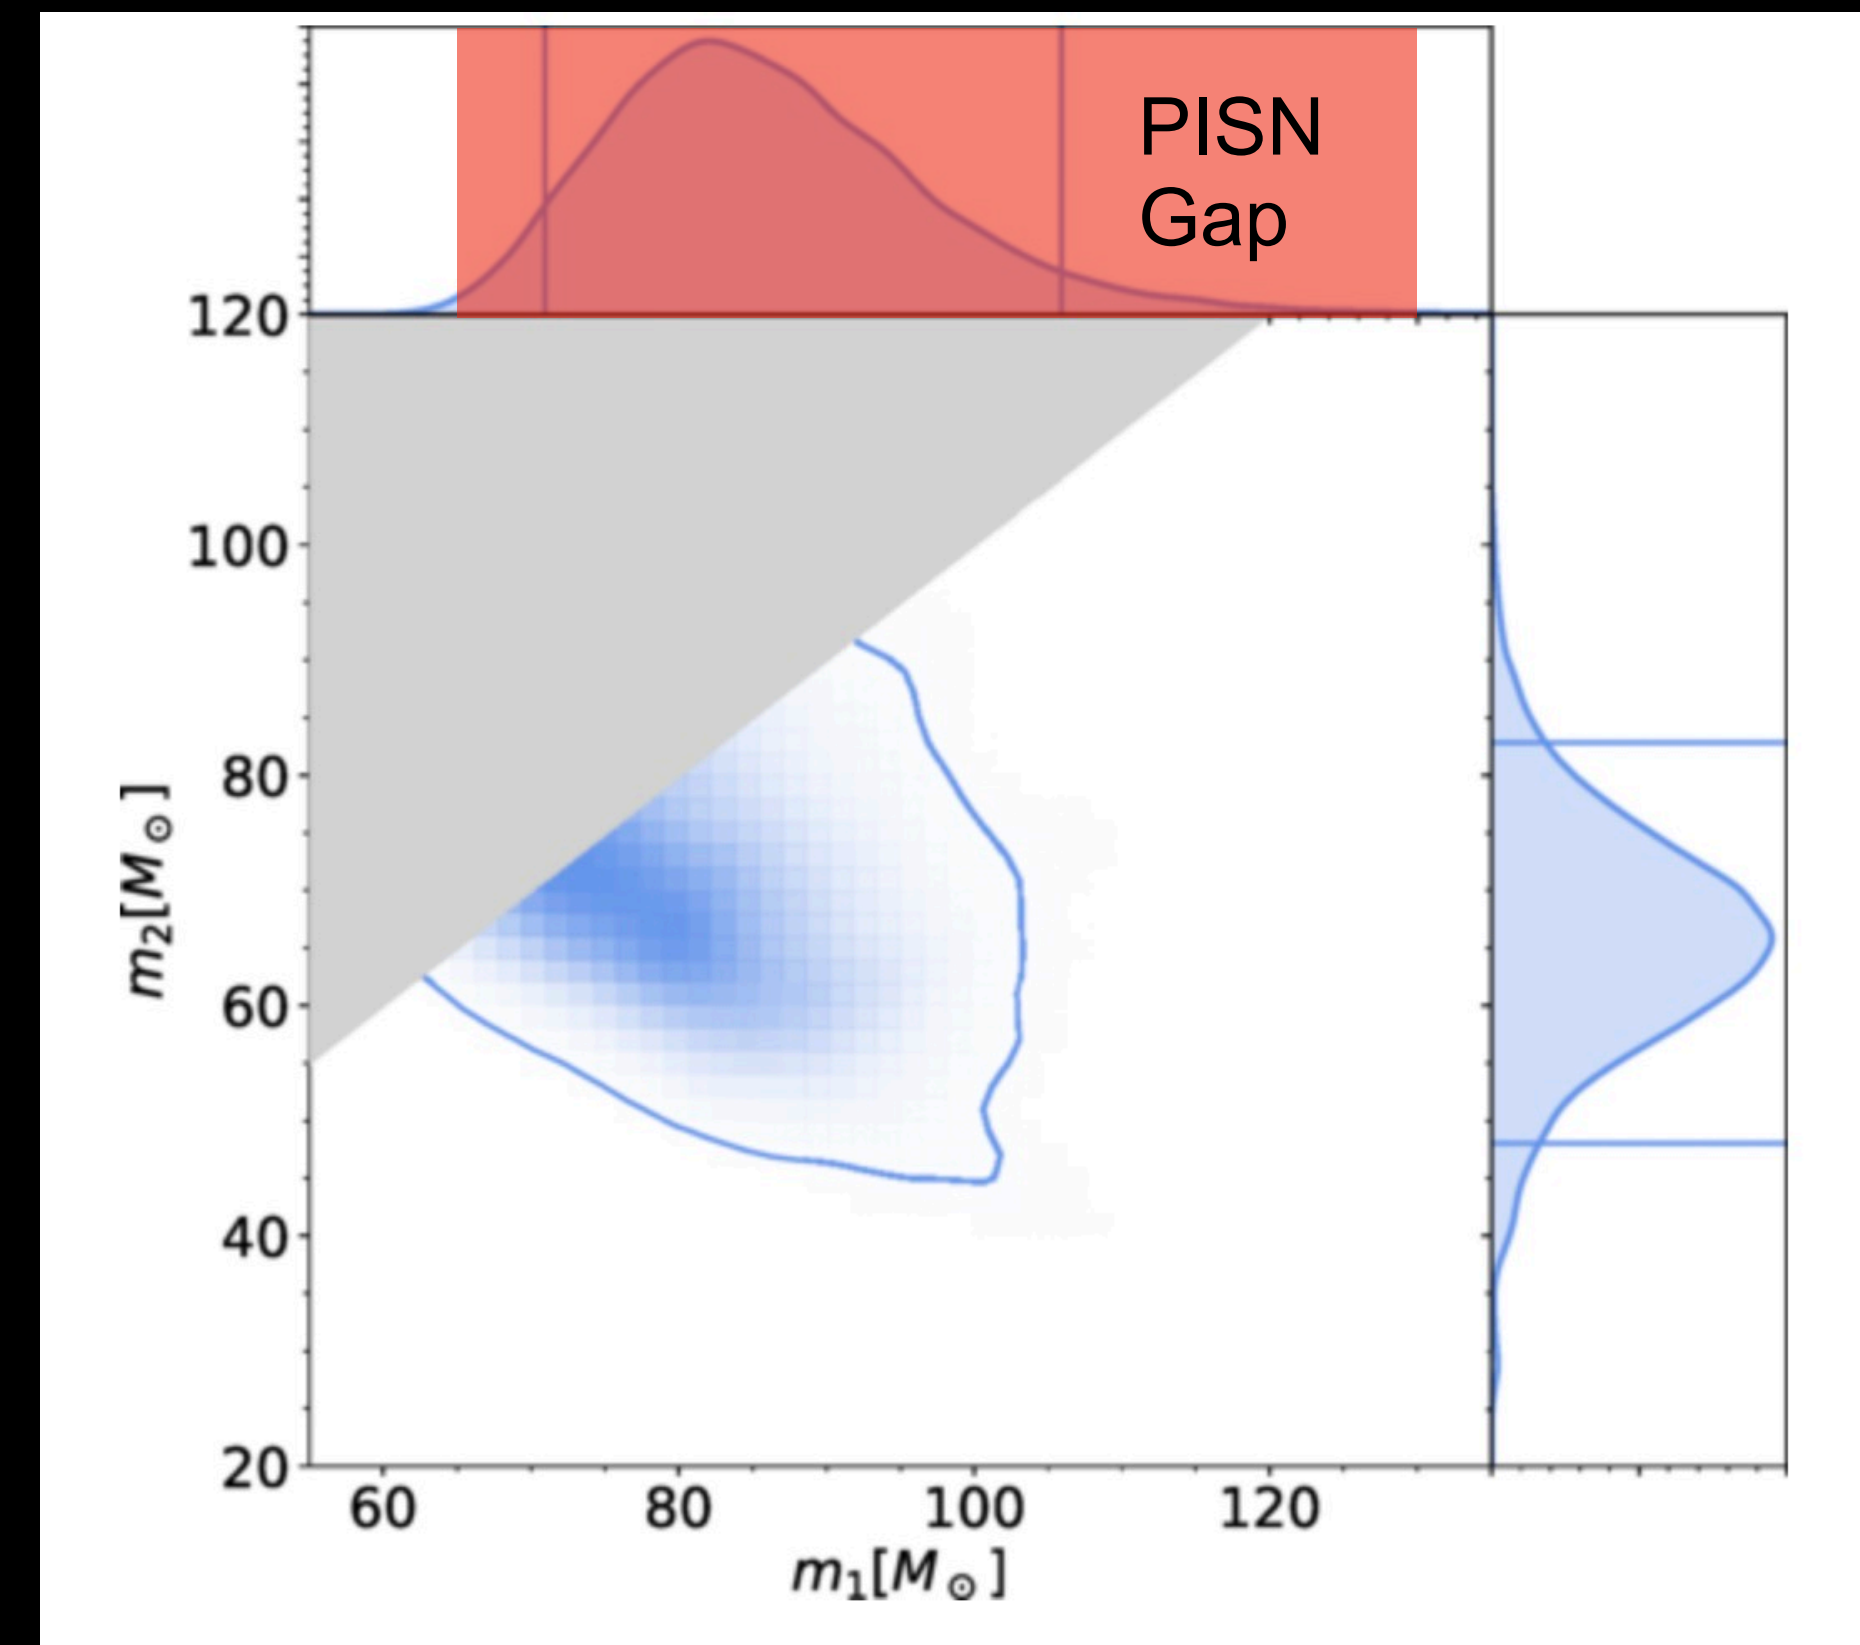

- Barely any pre-merger emission
- Remnant: intermediate-mass black hole.
- If BBH: primary black hole in the pair instability supernova gap.
- Mild precession signature

$$P(\text{precession} | \text{qBBH}) \text{ 10 : 1}$$

- Barely any pre-merger emission
 - Remnant: intermediate-mass black hole.
- If BBH: primary black hole in the pair instability supernova gap.

- Barely any pre-merger emission
 - Remnant: intermediate-mass black hole.
 - If BBH: primary black hole in the pair instability supernova gap.
 - If BBH: primary black hole in the pair instability supernova gap.

Self-gravitating Bose Einstein condensates of ultralight bosons

Compact objects with no event horizon (black hole mimickers)

- Can have spins larger than 1!!!
- Can produce highly spinning remnant black holes!

Two “new physics” parameters

- **Oscillation frequency of the field:**
 - Determines the “compactness” of the star
- **Boson mass:**
 - Determines the maximum mass of the star (before collapsing to a black hole)
- **Dark-Matter candidates**

Self-gravitating Bose Einstein condensates of ultralight bosons

	Scalar (s=0)		Vector (Proca) (s=1)		Tensor (s=2)	
Star	Real	Complex	Real	Complex	Real	Complex
Non-Spinning						
Spinning						

: Form **unstable** cloud around black-holes. SR instability. System spins-down, Continous waves. Current mass constraints.

: Form **stable** cloud around black-holes. SR equilibrium, spin of the system is kept. No Continous waves.

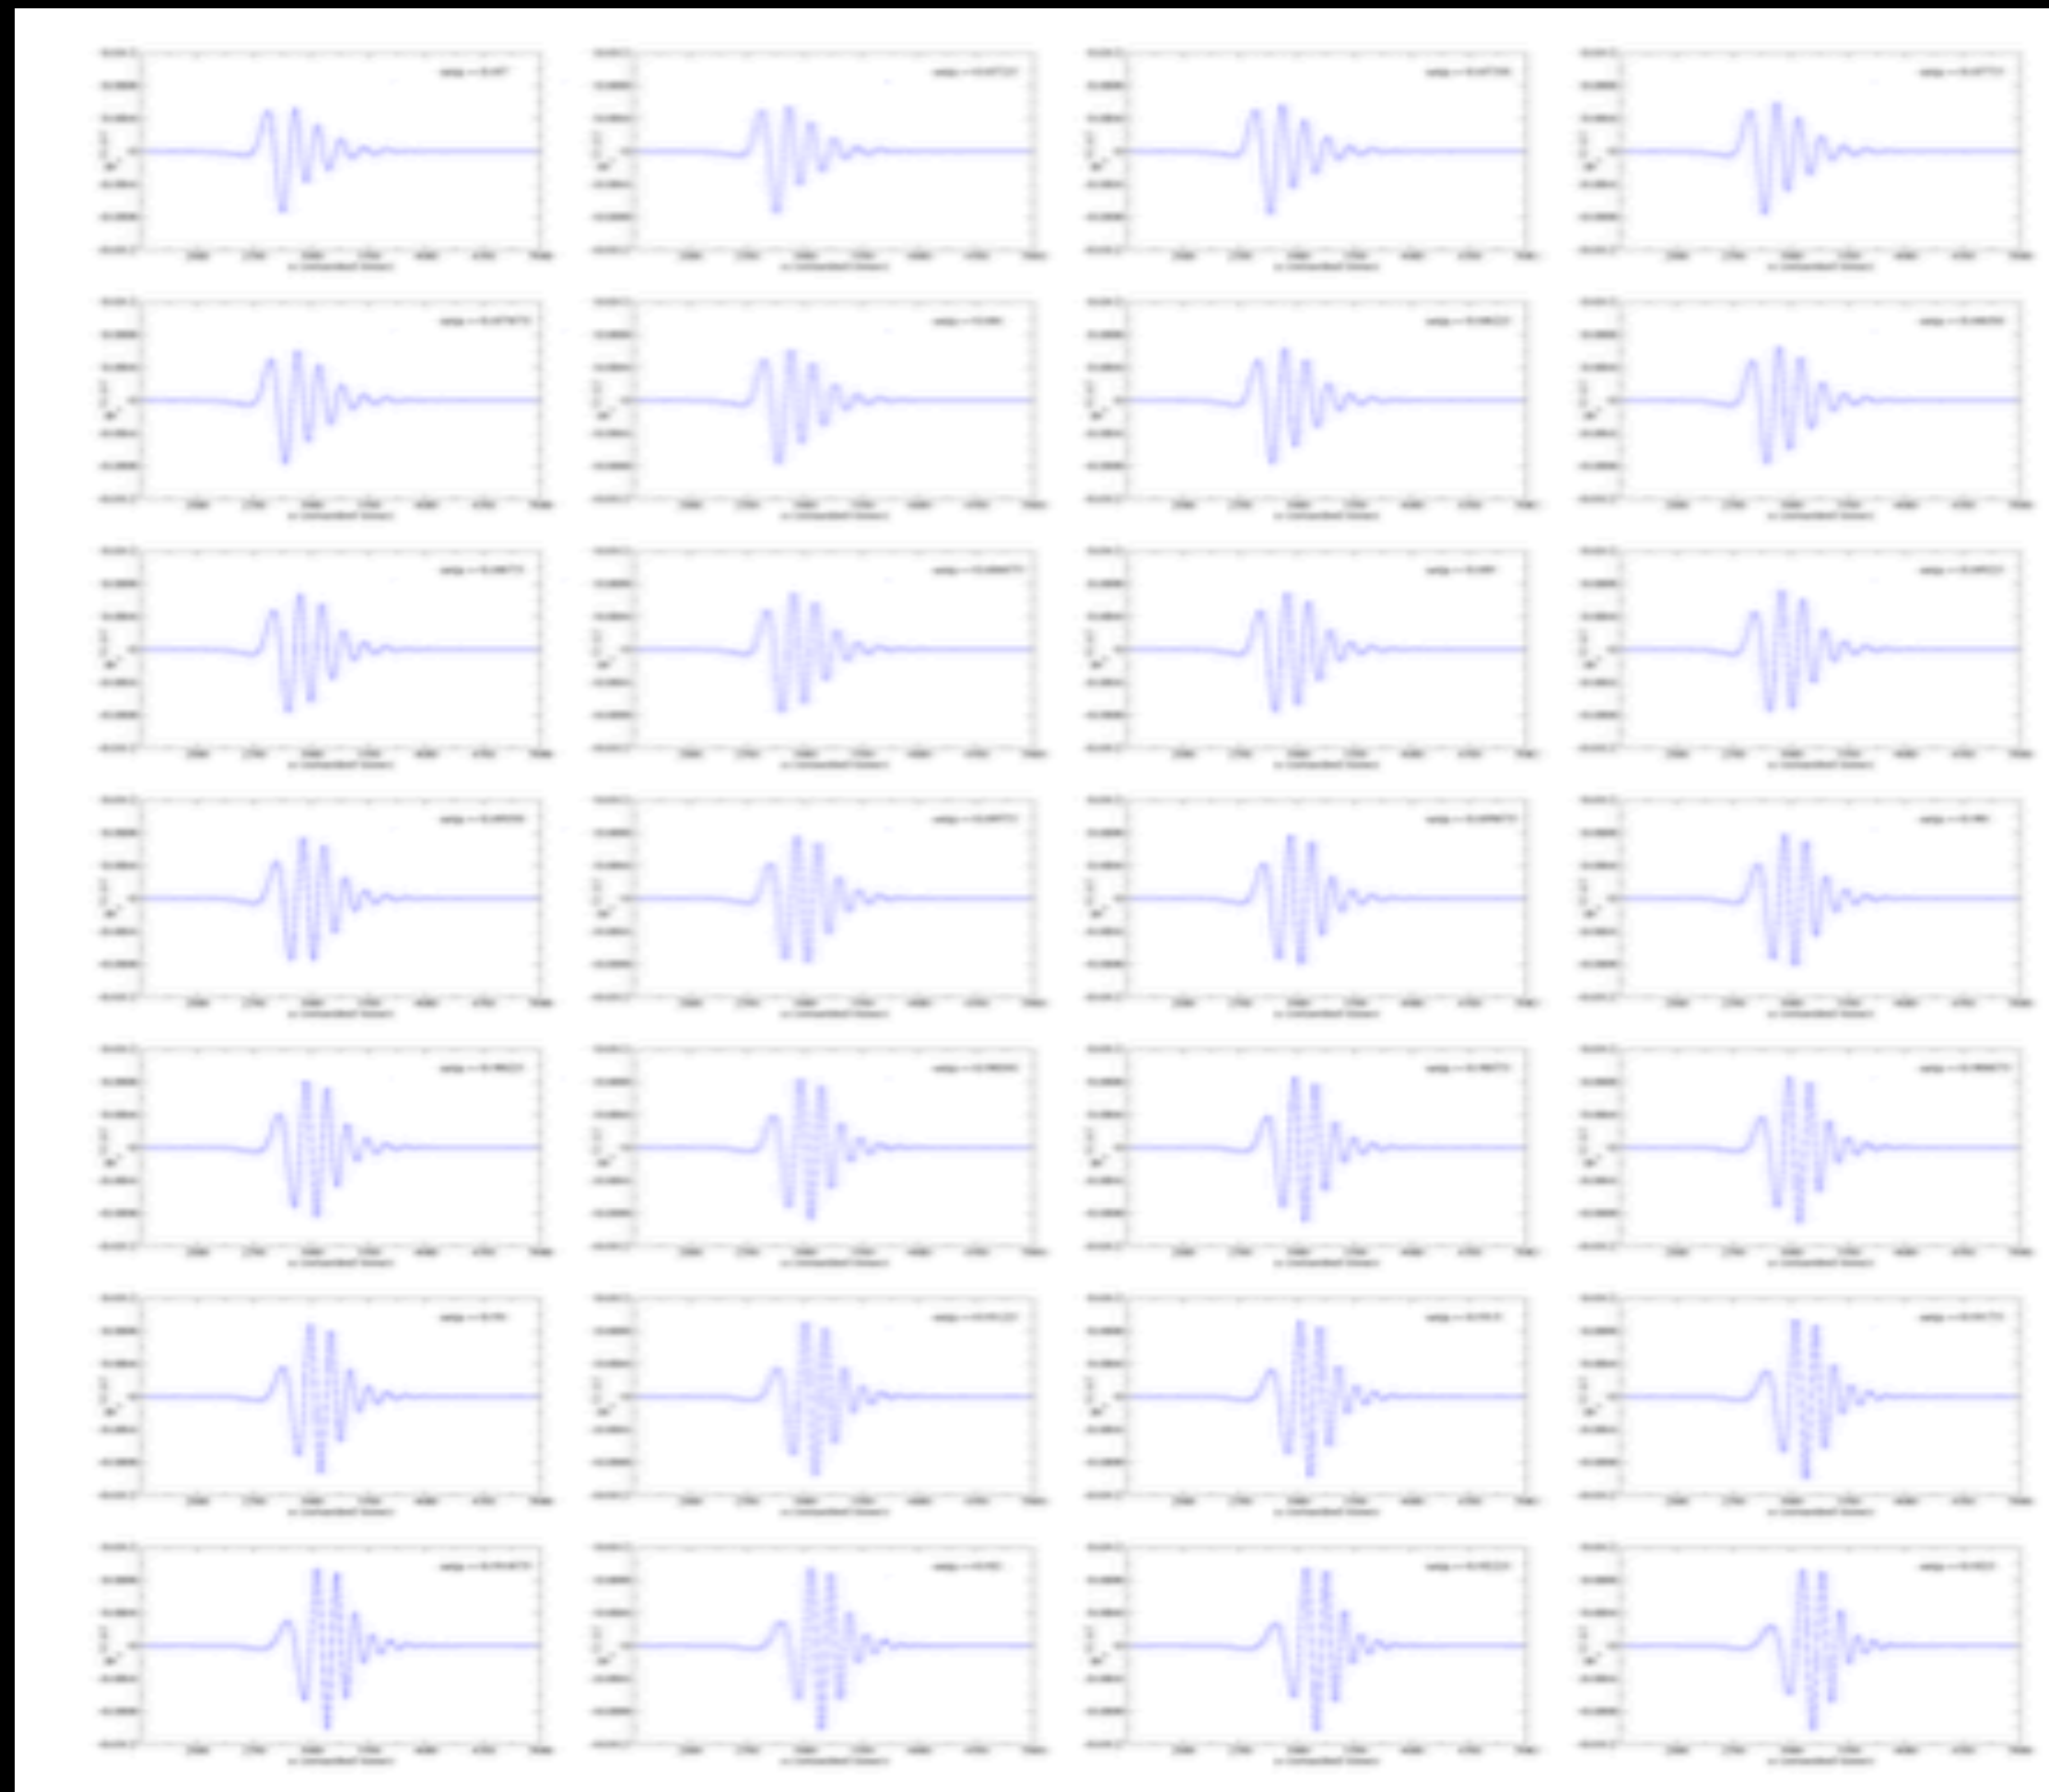

Spinning Proca star

Spinning Scalar star
(Unstable)

Equal-mass, equal field frequency (equal spin)

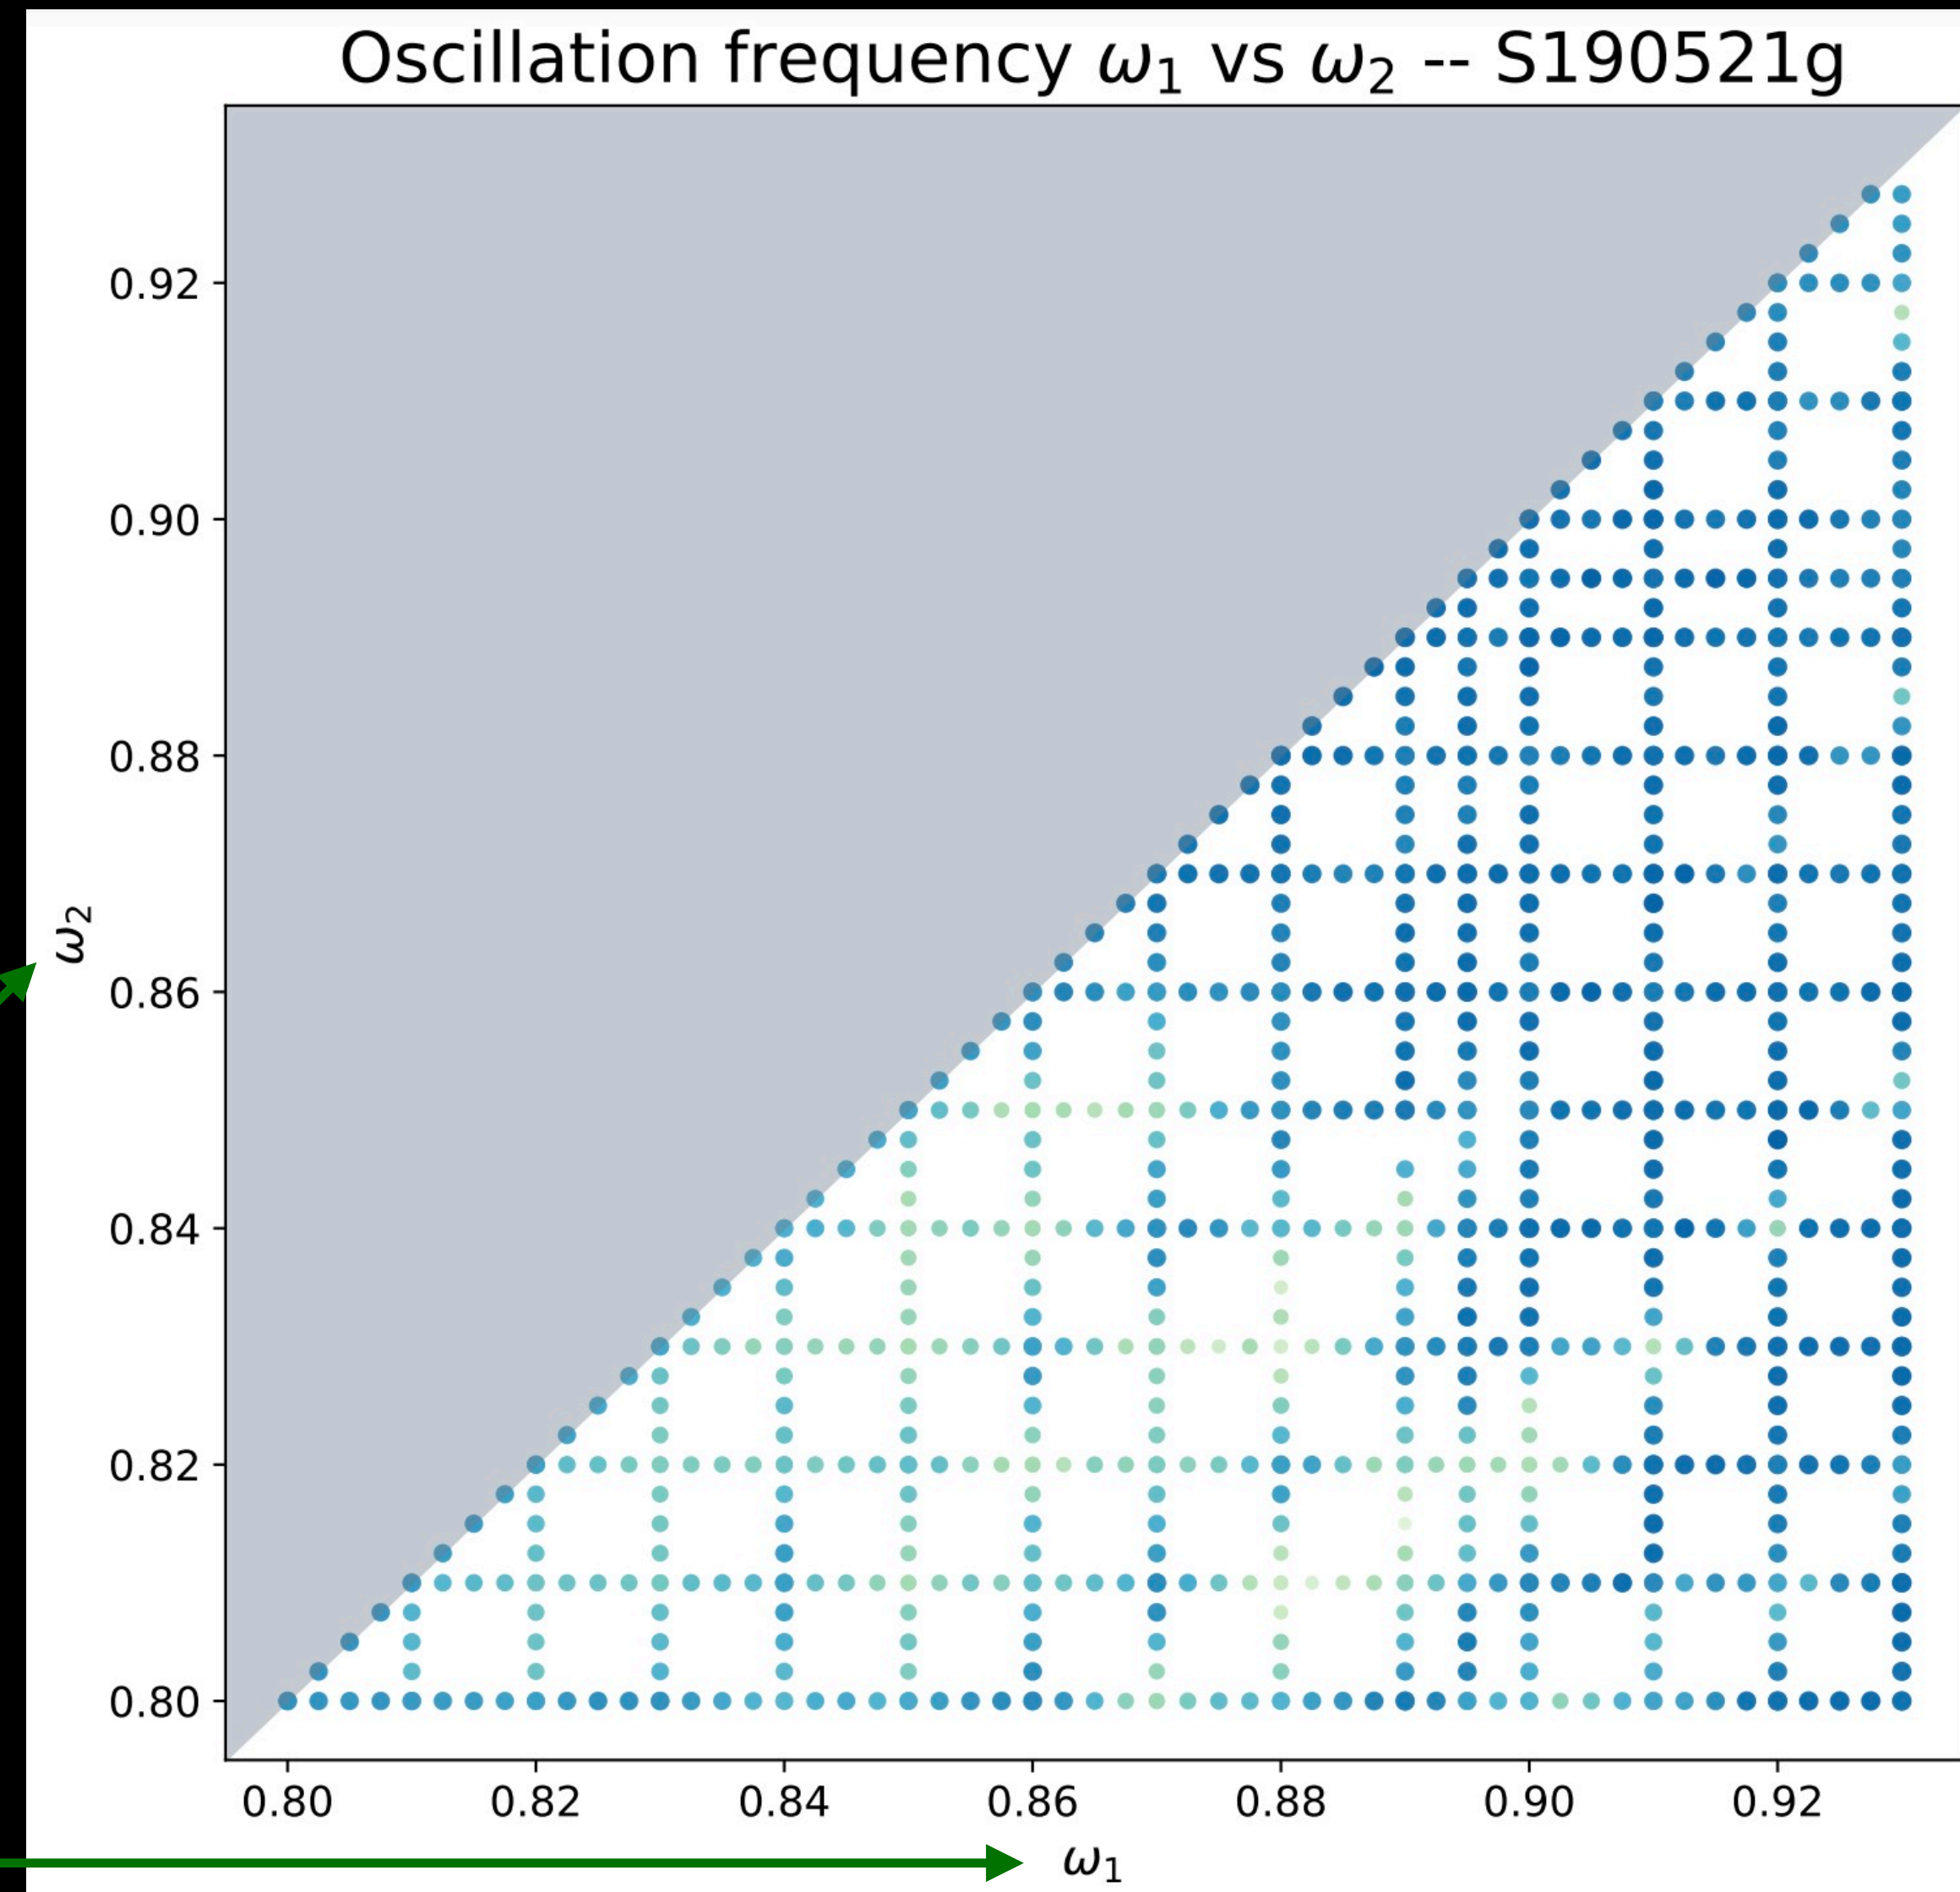

Initial separation = $100M$

einstein
toolkit

- 759 numerical (head-on) simulations
 - JCB+ 2020: reduced to 96 simulations
- Include (2,2), (2,0), (3,2), (3,3) modes

Proca-Star
vs.
Black-hole merger

Parameter estimates

- Analyse events beyond GW190521
 - GW200220 Part of the GWTC-3 catalogue (LVK 2021)
 - GW190426 Low significance (<1/year)
 - S200114f BBH estimate: 200Msun

- Analyse events beyond GW190521
 - GW200220 Part of the GWTC-3 catalogue (LVK 2021)
 - GW190426 Low significance (<1/year)
 - S200114f Heaviest merger to date

- Analyse events beyond GW190521
 - GW200220 Not published as an event but as a loud trigger (Abbott+ 2022)
 - GW190426 Significance much larger than other two events (1/30 year)
 - S200114f Extremely challenging for our waveform models

Not ruled out as a gravitational-wave detection

Best-fit waveforms (GW190521)

Event	GW190521	GW190426	GW200220	S200114f
$\beta_{\text{BBH}}^{\text{Proca}}$	2.5	2.0×10^{-4}	0.05	3.7

- Proca-Star mildly favoured: GW190521, S200114f
 - Proca-Star mildly rejected: GW200220 (though see next)
 - Proca-Star strongly rejected: GW190426
- 

GW190521 Parameters (Proca-star merger)

Parameter	$q = 1$ model	$q \neq 1$ model
Primary mass	$115_{-8}^{+7} M_{\odot}$	$115_{-8}^{+7} M_{\odot}$
Secondary mass	$115_{-8}^{+7} M_{\odot}$	$111_{-15}^{+7} M_{\odot}$
Total or final mass	$231_{-17}^{+13} M_{\odot}$	$228_{-15}^{+17} M_{\odot}$
Final spin	$0.75_{-0.04}^{+0.08}$	$0.75_{-0.04}^{+0.08}$
Inclination $\pi/2 - \iota - \pi/2 $	$0.83_{-0.47}^{+0.23}$ rad	$0.58_{-0.39}^{+0.40}$ rad
Azimuth	$0.65_{-0.54}^{+0.86}$ rad	$0.78_{-1.20}^{+1.23}$ rad
Luminosity distance	571_{-181}^{+348} Mpc	700_{-279}^{+292} Mpc
Redshift	$0.12_{-0.04}^{+0.05}$	$0.14_{-0.05}^{+0.06}$
Total or final redshifted mass	$258_{-9}^{+9} M_{\odot}$	$261_{-11}^{+10} M_{\odot}$
Bosonic field frequency ω/μ_V	$0.893_{-0.015}^{+0.015}$	(*) $0.905_{-0.042}^{+0.012}$
Boson mass μ_V [$\times 10^{-13}$]	$8.72_{-0.82}^{+0.73}$ eV	$8.59_{-0.57}^{+0.58}$ eV
Maximal boson star mass	$173_{-14}^{+19} M_{\odot}$	$175_{-11}^{+13} M_{\odot}$

LVC (BBH)

 $272_{-27}^{+26} M_{\odot}$

Circular mergers are louder
Larger initial mass needed to get same final BH

GW190521 Parameters (Proca-star merger)

Parameter	$q = 1$ model	$q \neq 1$ model
Primary mass	$115_{-8}^{+7} M_{\odot}$	$115_{-8}^{+7} M_{\odot}$
Secondary mass	$115_{-8}^{+7} M_{\odot}$	$111_{-15}^{+7} M_{\odot}$
Total or final mass	$231_{-17}^{+13} M_{\odot}$	$228_{-15}^{+17} M_{\odot}$
Final spin	$0.75_{-0.04}^{+0.08}$	$0.75_{-0.04}^{+0.08}$
Inclination $\pi/2 - i - \pi/2 $	$0.83_{-0.47}^{+0.23}$ rad	$0.58_{-0.39}^{+0.40}$ rad
Azimuth	$0.65_{-0.54}^{+0.86}$ rad	$0.78_{-1.20}^{+1.23}$ rad
Luminosity distance	571_{-181}^{+348} Mpc	700_{-279}^{+292} Mpc
Redshift	$0.12_{-0.04}^{+0.05}$	$0.14_{-0.05}^{+0.06}$
Total or final redshifted mass	$258_{-9}^{+9} M_{\odot}$	$261_{-11}^{+10} M_{\odot}$
Bosonic field frequency ω/μ_V	$0.893_{-0.015}^{+0.015}$	(*) $0.905_{-0.042}^{+0.012}$
Boson mass μ_V [$\times 10^{-13}$]	$8.72_{-0.82}^{+0.73}$ eV	$8.59_{-0.57}^{+0.58}$ eV
Maximal boson star mass	$173_{-14}^{+19} M_{\odot}$	$175_{-11}^{+13} M_{\odot}$

LVC (BBH)

$$5300_{-2400}^{+2600} \text{ Mpc}$$

Much closer than a BBH

$$272_{-27}^{+26} M_{\odot}$$

Circular mergers are louder
Larger initial mass needed to get same final BH

GW190521 Parameters (Proca-star merger)

Parameter	$q = 1$ model	$q \neq 1$ model
Primary mass	$115_{-8}^{+7} M_{\odot}$	$115_{-8}^{+7} M_{\odot}$
Secondary mass	$115_{-8}^{+7} M_{\odot}$	$111_{-15}^{+7} M_{\odot}$
Total or final mass	$231_{-17}^{+13} M_{\odot}$	$228_{-15}^{+17} M_{\odot}$
Final spin	$0.75_{-0.04}^{+0.08}$	$0.75_{-0.04}^{+0.08}$
Inclination $\pi/2 - \iota - \pi/2 $	$0.83_{-0.47}^{+0.23}$ rad	$0.58_{-0.39}^{+0.40}$ rad
Azimuth	$0.65_{-0.54}^{+0.86}$ rad	$0.78_{-1.20}^{+1.23}$ rad
Luminosity distance	571_{-181}^{+348} Mpc	700_{-279}^{+292} Mpc
Redshift	$0.12_{-0.04}^{+0.05}$	$0.14_{-0.05}^{+0.06}$
Total or final redshifted mass	$258_{-9}^{+9} M_{\odot}$	$261_{-11}^{+10} M_{\odot}$
Bosonic field frequency ω/μ_V	$0.893_{-0.015}^{+0.015}$	(*) $0.905_{-0.042}^{+0.012}$
Boson mass μ_V [$\times 10^{-13}$]	$8.72_{-0.82}^{+0.73}$ eV	$8.59_{-0.57}^{+0.58}$ eV
Maximal boson star mass	$173_{-14}^{+19} M_{\odot}$	$175_{-11}^{+13} M_{\odot}$

LVC (BBH)

$150_{-17}^{+29} M_{\odot}$

Much heavier than the BBH estimation

$5300_{-2400}^{+2600} Mpc$

Much closer than a BBH

$272_{-27}^{+26} M_{\odot}$

Circular mergers are louder
Larger initial mass needed to get same final BH

Event	GW190521	GW190426	GW200220	S200114f
$\mathcal{B}_{\text{BBH}}^{\text{Proca}}$	2.5	2.0×10^{-4}	0.05	3.7

- **Model:** population with given fraction ζ of Proca-star mergers.

$$p(\{d_i\}|\zeta) = \prod_{i=1}^N p(d_i|\text{PSM})\zeta + p(d_i|\text{BBH})(1 - \zeta)$$

$$\propto \prod_{i=1}^N \mathcal{B}_{\text{BBH}}^{\text{PSM}}\zeta + (1 - \zeta),$$

Event	GW190521	GW190426	GW200220	S200114f
$\mathcal{B}_{\text{BBH}}^{\text{Proca}}$	2.5	2.0×10^{-4}	0.05	3.7

- **Model:** population with given fraction ζ of Proca-star mergers.

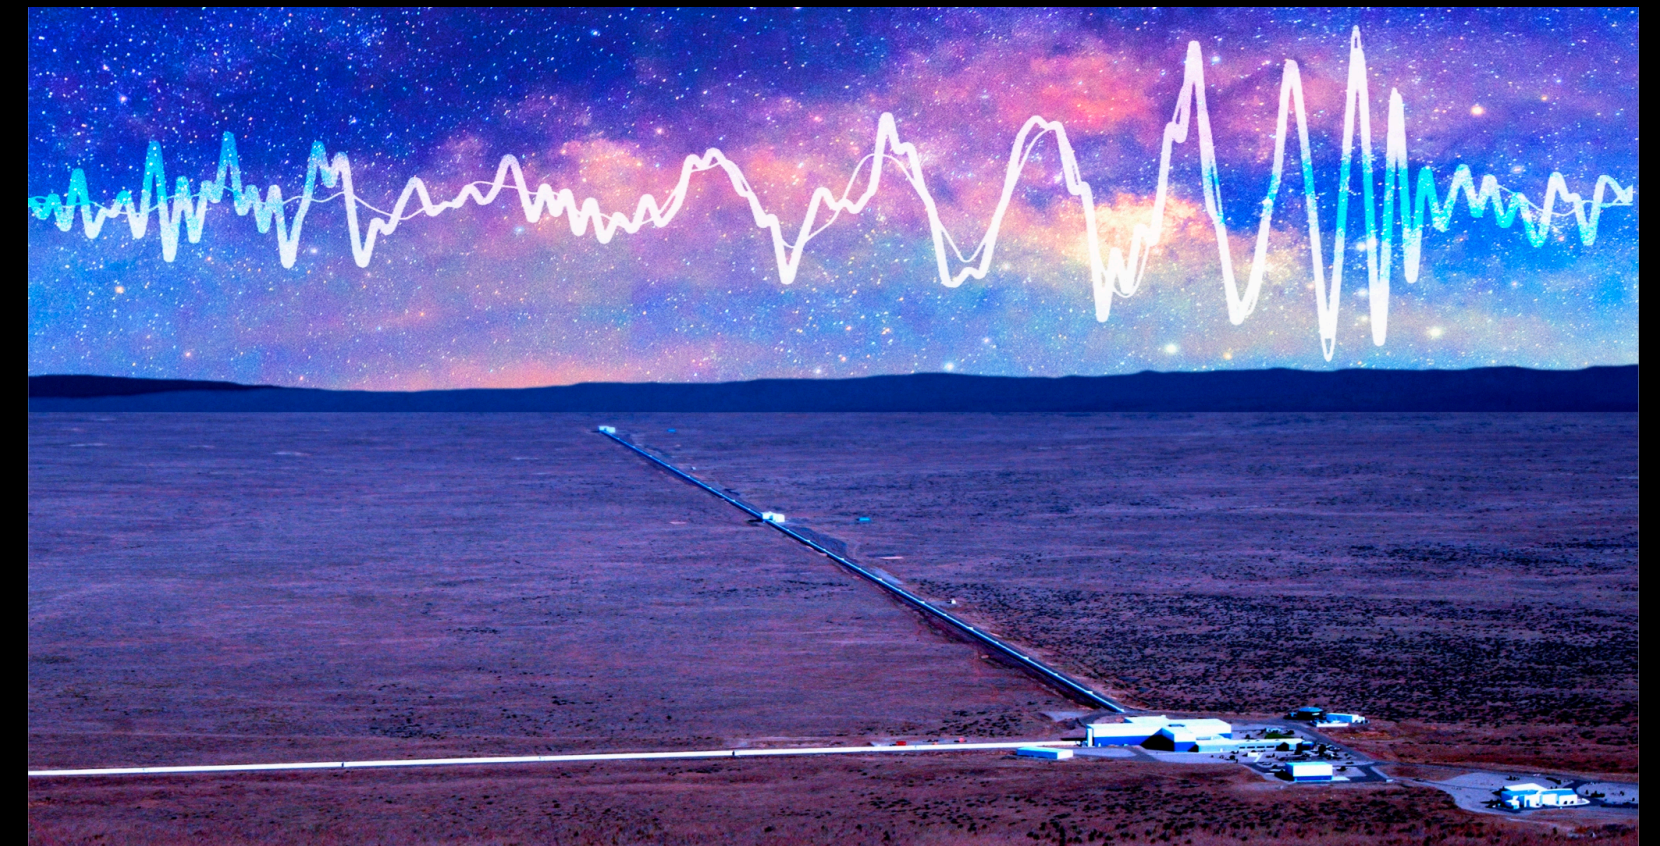

$$p(\{d_i\}|\zeta) = \prod_{i=1}^N p(d_i|\text{PSM})\zeta + p(d_i|\text{BBH})(1 - \zeta)$$

$$\propto \prod_{i=1}^N \mathcal{B}_{\text{BBH}}^{\text{PSM}}\zeta + (1 - \zeta),$$

Figure out ζ

Event	GW190521	GW190426	GW200220	S200114f
$\mathcal{B}_{\text{BBH}}^{\text{Proca}}$	2.5	2.0×10^{-4}	0.05	3.7

- **Model:** population with given fraction ζ of Proca-star mergers.

$$p(\{d_i\}|\zeta) = \prod_{i=1}^N p(d_i|\text{PSM})\zeta + p(d_i|\text{BBH})(1 - \zeta)$$

$$\propto \prod_{i=1}^N \mathcal{B}_{\text{BBH}}^{\text{PSM}} \zeta + (1 - \zeta),$$

- Obtain **posterior distribution** for ζ
 - **Ignore s200114f:**
 - Only one event prefers PSM, population peaks at zero
 - Removing loudness bias: peaks at ~ 0.3

- **Model:** population with given fraction ζ of Proca-star mergers.

$$p(\{d_i\}|\zeta) = \prod_{i=1}^N p(d_i|\text{PSM})\zeta + p(d_i|\text{BBH})(1 - \zeta)$$

$$\propto \prod_{i=1}^N \mathcal{B}_{\text{BBH}}^{\text{PSM}} \zeta + (1 - \zeta),$$

- Obtain **posterior distribution** for ζ

- **Ignore s200114f:**

- Only one event prefers PSM, population peaks at zero
- Removing loudness bias: peaks at ~ 0.3

- **Include s200114f:**

- Preference for PSM increases population fraction

- Can we **exploit mass-consistencies**? If so, one less parameter
 - Smaller Occam penalty for PSM model
 - Raise evidence for PSM vs. BBH model

- Can we exploit mass-consistencies? If so, one less parameter
 - Smaller Occam penalty for PSM model
 - Raise evidence for PSM vs. BBH model
- **Proposal:** use the posterior for GW190521 (most significant event) as our prior
 - New PSM-evidence for each individual event:

GW190521 posterior	Original event posterior	Mass-Overlap integral (Ashton+ 20)
-----------------------	-----------------------------	---------------------------------------

$$\mathcal{Z}_i^* = \mathcal{Z}_i \int p^{\text{GW190521}}(\mu_B) \frac{p(\mu_B)}{\pi(\mu_B)} d\mu_B = \mathcal{I}_{\mu_B}^{\text{GW190521},i} \mathcal{Z}_i$$

Original
evidence

Original prior

- Can we **exploit mass-consistencies**? If so, one less parameter
 - Smaller Occam penalty for PSM model
 - Raise evidence for PSM vs. BBH model
- **Proposal**: use the posterior for GW190521 (most significant event) as our prior
 - New PSM-evidence for each individual event:

	GW190521 posterior	Original event posterior	Mass-Overlap integral (Ashton+ 20)
	$\mathcal{Z}_i^* = \mathcal{Z}_i \int p^{\text{GW190521}}(\mu_B) \frac{p(\mu_B)}{\pi(\mu_B)} d\mu_B = \mathcal{I}_{\mu_B}^{\text{GW190521},i} \mathcal{Z}_i$		
	Original evidence	Original prior	

GW190521 + GW200220: $\mathcal{I} = 5.5$
 GW190521 + GW190426: $\mathcal{I} = 3.1$
 GW190521 + S200114f: $\mathcal{I} = 0.1$

- **Consistent mass across all events except 200114f**
 - Pushes PSM evidence
 - Pop. Fraction peaks away from zero
- **Inconsistent mass for s200114f:**
 - Penalises s200114f
 - Not much difference between including and including it
- **Also:** evidence for GW190521 “artificially” increased due to using its posterior as its own prior
 - Just a proof-of-concept study to exploit mass-consistencies
- **Next step** (working on it): more agnostic approach. Sample over population fraction(s) and boson mass(es)

- Some LIGO-Virgo detections are challenging to interpret as black-hole mergers

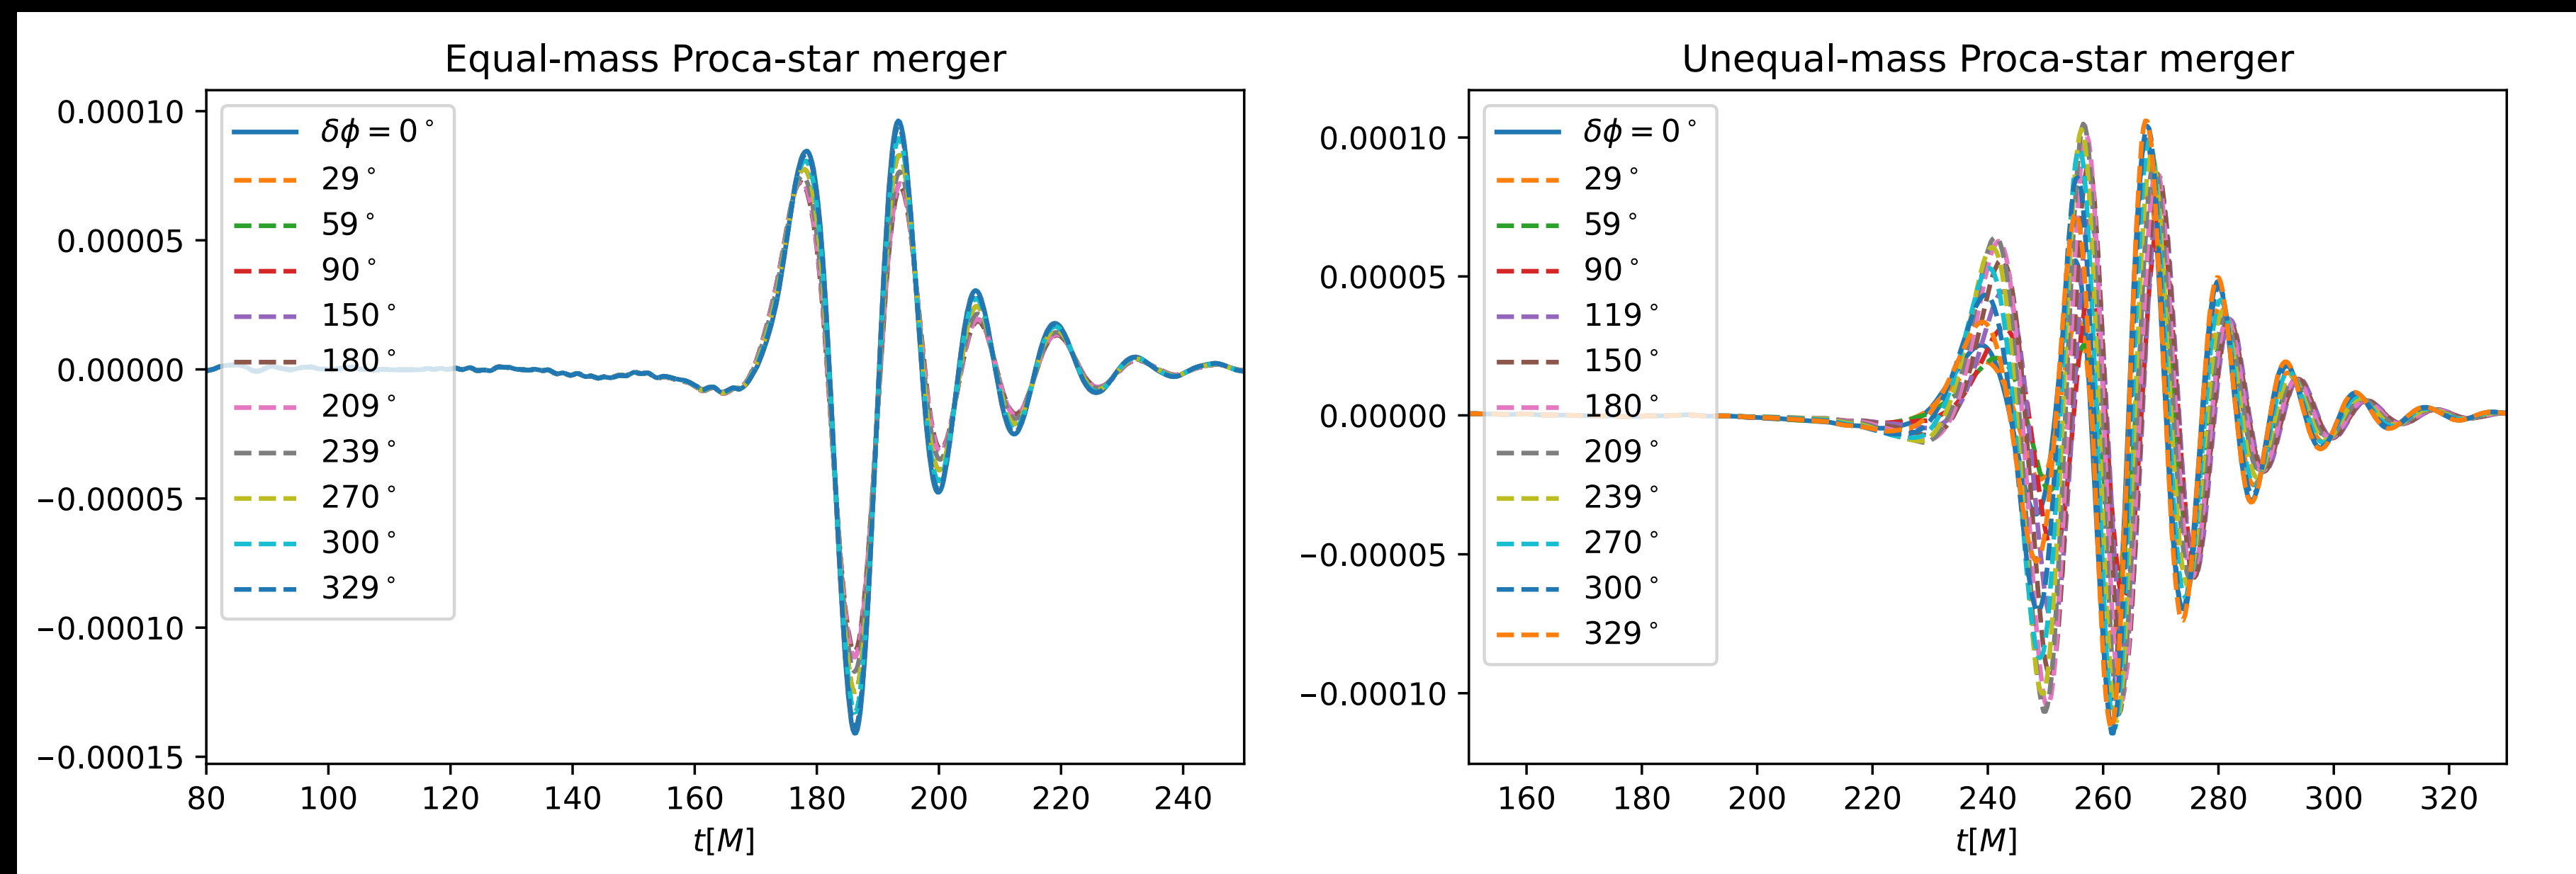

Boson (Proca)-stars are one of the simplest black-hole mimickers

Ultralight bosons are good candidates to form dark matter

- Catalog of boson-star simulations available (restricted to head-on mergers)
- Analysed GW190521: consistent with boson-star merger + boson mass estimate
First systematic comparison of LIGO-Virgo events to beyond BH models
- Will analyse future events: exploit boson-mass consistencies
- Targeted searches

- Proca field is complex: there is a phase $\phi(t)$ characterising the star
 - Relative phase $\Delta\phi(t) = \phi_1(t) - \phi_2(t)$ controls how stars interact, specially at merger
 - In all previous cases $\Delta\phi(t=0) = 0$
 - However $\Delta\phi(t_{merger})$ varies across our catalog

- Proca field is complex: there is a phase $\phi(t)$ characterising the star
 - Relative phase $\Delta\phi(t) = \phi_1(t) - \phi_2(t)$ controls how stars interact, specially at merger
 - In all previous cases $\Delta\phi(t=0) = 0$
 - However $\Delta\phi(t_{merger})$ varies across our catalog

- Proca field is complex: there is a phase $\phi(t)$ characterising the star
 - Relative phase $\Delta\phi(t) = \phi_1(t) - \phi_2(t)$ controls how stars interact, specially at merger
 - In all previous cases $\Delta\phi(t=0) = 0$
 - However $\Delta\phi(t_{merger})$ varies across our catalog

- Perform simulations for varying $\Delta\phi(t_{initial})$
 - Ideally, do this for all of our initial catalog
 - For now: 12 selected cases
 - Working on a ~3000 simulation catalog
 - Bayesian inference on GW190521

- Perform simulations for varying $\Delta\phi(t_{initial})$
 - Ideally, do this for all of our initial catalog
